List of Figures

1 General

1.1 Overview

This document is the non-proprietary FIPS 140-3 Security Policy for version 1.0 of the SUSE Linux Enterprise OpenSSL 3 Cryptographic Module. It contains the security rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-3 (Federal Information Processing Standards Publication 140-3) for an overall Security Level 1 module.

This Non-Proprietary Security Policy may be reproduced and distributed, but only whole and intact and including this notice. Other documentation is proprietary to their authors.

1.1.1 How this Security Policy was prepared

In preparing the Security Policy document, the laboratory formatted the vendor-supplied documentation for consolidation without altering the technical statements therein contained. The further refining of the Security Policy document was conducted iteratively throughout the conformance testing, wherein the Security Policy was submitted to the vendor, who would then edit, modify, and add technical contents. The vendor would also supply additional documentation, which the laboratory formatted into the existing Security Policy, and resubmitted to the vendor for their final editing.

1.2 Security Levels

Section	Title	Security Level

2 Cryptographic Module Specification

2.1 Description

Purpose and Use:

The SUSE Linux Enterprise OpenSSL 3 Cryptographic Module (hereafter referred to as "the module") is defined as a software module in a multi-chip standalone embodiment. It provides a C language application program interface (API) for use by other applications that require cryptographic functionality. The module is a software library supporting FIPS 140-3 approved algorithms developed by SUSE LLC for its use by other applications that require cryptographic functionality and consists of one software component, the "FIPS provider", which implements the FIPS requirements and the cryptographic functionality provided to the operator.

Module Type: Software

Module Embodiment: MultiChipStand

Cryptographic Boundary:

The cryptographic boundary of the module is defined as the fips.so shared library, which contains the compiled code implementing the FIPS provider.

Tested Operational Environment's Physical Perimeter (TOEPP):

The TOEPP of the module is defined as the general-purpose computer on which the module is installed.

Figure 1 shows a block diagram that represents the design of the module when the module is operational and providing services to other user space applications. In this diagram, the physical perimeter of the operational environment (a general-purpose computer on which the module is installed) is indicated by a purple dashed line. The cryptographic boundary is represented by the components painted in orange blocks, which consists only of the shared library implementing the FIPS provider (fips.so).

The "Data/Control Input" and "Data/Status Output" arrows indicate the flow of data between the cryptographic module and its operator application, through the logical interfaces defined in Section 3 Cryptographic Module Interfaces.

Components in white are only included in the diagram for informational purposes. They are not included in the cryptographic boundary (and therefore not part of the module's validation). For example, the kernel is responsible for managing system calls issued by the module itself, as well as other applications using the module for cryptographic services.

2.2 Tested and Vendor Affirmed Module Version and Identification

Tested Module Identification – Hardware:

N/A for this module.

Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets):

Package or File Name	Software/ Firmware Version	Features	Integrity Test
fips.so on SUSE Linux Enterprise Server 15 SP6 and AMD EPYCTM 7343	1.0	N/A	HMAC-SHA2-256
fips.so on SUSE Linux Enterprise Server 15 SP6 and Intel® Xeon® Gold 5416S	1.0	N/A	HMAC-SHA2-256
fips.so on SUSE Linux Enterprise Server 15 SP6 and IBM® TelumTM	1.0	N/A	HMAC-SHA2-256

Package or File Name	Software/ Firmware Version	Features	Integrity Test
fips.so on SUSE Linux Enterprise Server 15 SP6 and Ampere® Altra® Q80-30	1.0	N/A	HMAC-SHA2-256

Table 2: Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets)

Tested Module Identification – Hybrid Disjoint Hardware:

N/A for this module.

Tested Operational Environments - Software, Firmware, Hybrid:

Operating System	Hardware Platform	Processors	PAA/PAI	Hypervisor or Host OS	Version(s)
SUSE Linux Enterprise Server 15 SP6	SuperMicro SuperChassis 825BTQC-R1K23LPB and Motherboard H12DSi-NT6	AMD EPYCTM 7343	Yes	N/A	1.0
SUSE Linux Enterprise Server 15 SP6	SuperMicro SuperChassis 825BTQC-R1K23LPB and Motherboard H12DSi-NT6	AMD EPYCTM 7343	No	N/A	1.0
SUSE Linux Enterprise Server 15 SP6	GIGABYTE R152-P30	Ampere® Altra® Q80-30	Yes	N/A	1.0
SUSE Linux Enterprise Server 15 SP6	GIGABYTE R152-P30	Ampere® Altra® Q80-30	No	N/A	1.0
SUSE Linux Enterprise Server 15 SP6	IBM z16 A01	IBM® TelumTM	Yes	N/A	1.0
SUSE Linux Enterprise Server 15 SP6	IBM z16 A01	IBM® TelumTM	No	N/A	1.0
SUSE Linux Enterprise Server 15 SP6	ASUS RS700-E11-RS4U	Intel® Xeon® Gold 5416S	Yes	N/A	1.0

Operating System	Hardware Platform	Processors	PAA/PAI	Hypervisor or Host OS	Version(s)
SUSE Linux Enterprise Server 15 SP6	ASUS RS700-E11-RS4U	Intel® Xeon® Gold 5416S	No	N/A	1.0

Table 3: Tested Operational Environments - Software, Firmware, Hybrid

Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid:

Operating System	Hardware Platform

SUSE Linux Enterprise Base Container Image 15SP6	GIGABYTE R152-P30 on Ampere® Altra® Q80-30
SUSE Linux Enterprise Server for SAP 15SP6	QEMU VM on Ampere® Altra® Q80-30
SUSE Linux Enterprise Base Container Image 15SP6	QEMU VM on Ampere® Altra® Q80-30
SUSE Linux Enterprise Server 15SP6	QEMU VM on Ampere® Altra® Q80-30
SUSE Linux Enterprise Server 15SP6	QEMU VM on Intel® Xeon® Gold 6338
SUSE Linux Enterprise Server for SAP 15SP6	QEMU VM on Intel® Xeon® Gold 5218R

Table 4: Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid

CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.

2.3 Excluded Components

There are no components excluded from the requirements of the FIPS 140-3 standard.

2.4 Modes of Operation

Modes List and Description:

Mode Name	Description	Type	Status Indicator
Approved mode	Automatically entered whenever an approved service is requested	Approved	Equivalent to the indicator of the requested service
Non-approved mode	Automatically entered whenever a non-approved service is requested	Non-Approved	Equivalent to the indicator of the requested service

Table 5: Modes List and Description

After passing all pre-operational self-tests and cryptographic algorithm self-tests executed on start-up, the module automatically transitions to the approved mode. No operator intervention is required to reach this point. The module operates in the approved mode of operation by default and can only transition into the non-approved mode by calling one of the non-approved services listed in the Non-Approved Services table of the Security Policy.

In the operational state, the module accepts service requests from calling applications through its logical interfaces. At any point in the operational state, a calling application can end its process, causing the module to end its operation.

Mode Change Instructions and Status:

The module automatically switches between the approved and non-approved modes depending on the services requested by the operator. The status indicator of the mode of operation is equivalent to the indicator of the service that was requested.

2.5 Algorithms

Approved Algorithms:

Table 6: Approved Algorithms

Vendor-Affirmed Algorithms:

Name	Properties	Implementation	Reference
Asymmetric Cryptographic Key Generation (CKG)		N/A	SP 800-133 Rev. 2, section 4, example 1

Table 7: Vendor-Affirmed Algorithms

Non-Approved, Allowed Algorithms:

N/A for this module.

The module does not implement non-approved algorithms that are allowed in the approved mode of operation.

Non-Approved, Allowed Algorithms with No Security Claimed:

N/A for this module.

The module does not implement non-approved algorithms that are allowed in the approved mode of operation with no security claimed.

Non-Approved, Not Allowed Algorithms:

Name	Use and Function
AES GCM (external IV)	Authentication Encryption
HMAC (< 112-bit keys)	Message Authentication Code
KBKDF, KDA OneStep, KDA TwoStep, HKDF, ANS X9.42 KDF, ANS X9.63 KDF (< 112-bit keys)	Key Derivation
KDA OneStep, KDA TwoStep (SHAKE128, SHAKE256)	Key Derivation
ANS X9.42 KDF (SHAKE128, SHAKE256)	Key Derivation
ANS X9.63 KDF (SHA-1, SHAKE128, SHAKE256)	Key Derivation

Name	Use and Function
SSH KDF (SHA-512/224, SHA-512/256, SHA-3, SHAKE128, SHAKE256)	Key Derivation
TLS 1.2 KDF (SHA-1, SHA-224, SHA-512/224, SHA-512/256, SHA-3)	TLS Key Derivation
TLS 1.3 KDF (SHA-1, SHA-224, SHA-512, SHA-512/224, SHA-512/256, SHA-3)	TLS Key Derivation
PBKDF2 (< 8 characters password; < 128 salt length; < 1000 iterations; < 112-bit keys)	Password-based Key Derivation
RSA and ECDSA (pre-hashed message)	Signature generation; Signature verification
RSA-PSS (invalid salt length: FIPS 186-5, section 5.4, item(g))	Signature generation; Signature verification

Table 8: Non-Approved, Not Allowed Algorithms

The table above lists all non-approved cryptographic algorithms of the module employed by the non-approved services of the Non-Approved Services table in Section 4.4 Non-Approved Services.

2.6 Security Function Implementations

Name	Type	Description	Properties	Algorithms
Symmetric Encryption with AES	BC-UnAuth	Symmetric encryption using AES	AES-ECB: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CBC: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CBC-CS1: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CBC-CS2: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security	AES-CBC: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CBC-CS1: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CBC-CS2: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CBC-CS3: (A5398, A5399, A5400, A5401, A5402, A5403, A5658)

Name	Type	Description	Properties	Algorithms
			strength AES-CBC-CS3: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CFB1: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CFB128: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CFB8: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CTR: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-OFB: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-XTS Testing Revision 2.0: 256-, 512-bit keys with 128, 256 bits of security strength	AES-CFB1: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CFB128: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CFB8: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CTR: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-ECB: (A5398, A5399, A5400, A5401, A5402, A5403, A5658, A5884, A5893, A5894, A5895, A5896, A5900) AES-OFB: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-XTS Testing Revision 2.0: (A5398, A5399, A5400, A5401, A5402, A5403, A5658)
Symmetric Decryption with AES	BC-UnAuth	Symmetric decryption using AES	AES-ECB: 128-, 192-, 256-bit keys with 128, 192, 256 bits of security strength AES-CBC: 128-, 192-, 256-bit keys with 128, 192, 256	AES-CBC: (A5398, A5399, A5400, A5401, A5402, A5403, A5658) AES-CBC-CS1: (A5398, A5399, A5400, A5401, A5402, A5403,

Name	Type	Description	Properties	Algorithms

Table 9: Security Function Implementations

2.7 Algorithm Specific Information

2.7.1 AES GCM IV

For TLS 1.2, the module offers the AES GCM implementation and uses the context of Scenario 1 of FIPS 140-3 IG C.H. The module is compliant with SP 800-52 Rev. 2 Section 3.3.1 and the mechanism for IV generation is compliant with RFC 5288 and 8446.

The module does not implement the TLS protocol. The module's implementation of AES GCM is used together with an application that runs outside the module's cryptographic boundary. The design of the TLS protocol implicitly ensures that the counter (the nonce_explicit part of the IV) does not exhaust the maximum number of possible values for a given session key.

In the event the module's power is lost and restored, the consuming application must ensure that a new key for use with the AES GCM key encryption or decryption under this scenario shall be established.

Alternatively, the Crypto Officer can use the module's API to perform AES GCM encryption using internal IV generation. These IVs are always 96 bits and generated using the approved DRBG internal to the module's boundary, compliant to Scenario 2 of FIPS 140-3 IG C.H.

The module also provides a non-approved AES GCM encryption service which accepts arbitrary external IVs from the operator. This service can be requested by invoking the EVP_EncryptInit_ex2 API function with a non-NULL IV value. When this is the case, the API will set a non-approved service indicator.

Finally, for TLS 1.3, the AES GCM implementation uses the context of Scenario 5 of FIPS 140-3 IG C.H. The protocol that provides this compliance is TLS 1.3, defined in RFC8446 of August 2018, using the cipher-suites that explicitly select AES GCM as the encryption/decryption cipher (Appendix B.4 of RFC8446). The module supports acceptable AES GCM cipher suites from Section 3.3.1 of SP 800-52 Rev. 2. The module's implementation of AES GCM is used together with an application that runs outside the module's cryptographic boundary. The design of the TLS protocol implicitly ensures that the counter (the nonce_explicit part of the IV) does not exhaust the maximum number of possible values for a given session key.

2.7.2 AES XTS

The length of a single data unit encrypted or decrypted with AES XTS shall not exceed 2^{20} AES blocks, that is 16MB, of data per XTS instance. An XTS instance is defined in Section 4 of SP 800-38E.

To meet the requirement stated in IG C.I, the module implements a check that ensures, before performing any cryptographic operation, that the two AES keys used in AES XTS mode are not identical. As the module does not generate symmetric keys, the check is performed when keys are input the service APIs.

Key_1 and Key_2 shall be generated and/or established independently according to the rules for component symmetric keys from NIST SP 800-133rev2, Sec. 6.3.

The XTS mode shall only be used for the cryptographic protection of data on storage devices. It shall not be used for other purposes, such as the encryption of data in transit.

2.7.3 Key Derivation using SP 800-132 PBKDF2

The module provides password-based key derivation (PBKDF2), compliant with SP 800-132. The module supports option 1a from Section 5.4 of SP 800-132, in which the Master Key (MK) or a segment of it is used directly as the Data Protection Key (DPK). In accordance to SP 800-132 and FIPS 140-3 IG D.N, the following requirements are met:

- Derived keys shall be used only for storage applications, and shall not be used for any other purposes. The length of the MK or DPK is 112 bits or more.
- Passwords or passphrases, used as an input for the PBKDF2, shall not be used as cryptographic keys.
- The minimum length of the password or passphrase accepted by the module is 8 characters. The probability of guessing the value, assuming a worst-case scenario of all digits, is estimated to be at most 10^{-8}. Combined with the minimum iteration count as described below, this provides an acceptable trade-off between user experience and security against brute-force attacks.

- A portion of the salt shall be generated randomly using the SP 800-90A Rev. 1 DRBG provided by the module. The minimum length required is 128 bits.
- The iteration count shall be selected as large as possible, as long as the time required to generate the key using the entered password is acceptable for the users. The minimum value accepted by the module is 1000.

If any of these requirements are not met, the requested service is non-approved (see Non-Approved Services table in Section 4.4 Non-Approved Services).

2.7.4 SP 800-56A Rev. 3 Assurances

To comply with the assurances found in Section 5.6.2 of SP 800-56A Rev. 3, the operator must use the module together with an application that implements the TLS protocol. Additionally, the module's approved key pair generation service (see Approved Services table in Section 4.3 Approved Services) must be used to generate ephemeral Diffie-Hellman or EC Diffie-Hellman key pairs, or the key pairs must be obtained from another FIPS-validated module. As part of this service, the module will internally perform the full public key validation of the generated public key.

The module's shared secret computation service will internally perform the full public key validation of the peer public key, complying with Sections 5.6.2.2.1 and 5.6.2.2.2 of SP 800-56A Rev. 3.

2.7.5 SHA-3

The module implements the SHA-3 algorithms as both standalone and part of higher-level algorithms (in compliance with FIPS 140-3 IG C.C). As detailed in Section 2.6 Security Function Implementations with corresponding certificates, the cryptographic algorithms that use of SHA-3 include RSA signature generation and verification, ECDSA signature generation and verification, KBKDF, KDA HKDF, X9.63 KDF, X9.42 KDF, PBKDF, OneStep KDA, and HMAC. In addition, the implementation of the extendable output functions SHAKE128 and SHAKE256 were verified to have a standalone usage.

2.7.6 RSA Signatures

The module supports RSA Signature Verification for 1024, 1280, 1536 and 1792-bit keys. This is allowed by FIPS 140-3 IG C.F. Specifically, 1280 and 1792 cannot be CAVP tested but are approved for signature verification in IG C.F.

The 1024-bit modulus has been CAVP tested for RSA signature verification in compliance with FIPS 186-4, while the 1536-bit modulus has been CAVP tested for RSA signature verification in compliance with FIPS 186-2.

For all other approved moduli (namely 2048, 3072, and 4096 bit keys) supported by the module, RSA signature verification is approved and CAVP tested in compliance with FIPS 186-5.

2.7.7 RSA Key Agreement

To comply with the assurances found in Section 6.4 of SP 800-56B Rev. 2, the module's approved RSA key pair generation service (see Table 9) must be used to generate the RSA key pairs, or the key pairs must be obtained from another FIPS-validated module. As part of this service, the module will internally perform the key pair validity and the pairwise consistency according to Section 6.4.1.1 of SP 800-56B Rev. 2.

Additionally, the entity requesting the shared secret computation service shall verify the validity of the peer's public key using the public key validation service of the module (EVP_PKEY_check() API). This service will perform the full public key validation of the peer's public key, complying with Section 6.4.2.1 of SP 800-56B Rev. 2.

2.7.8 Compliance to SP 800-56Br2 Assurances

To comply with the assurances found in Section 6.4 of SP 800-56Br2, the operator must use the module in the context of the TLS or SSH protocols. Additionally, the module's approved key pair generation service (see Section 4.3) must be used to generate RSA key pairs, or the key pairs must be obtained from another FIPS-validated module. As part of this service, the module will internally perform the key pair validation of the generated public key.

The operator must use the EVP_PKEY_public_check() API to perform partial public key validation of the peer public key, complying with Section 6.4.2.2 of SP 800-56Br2. The operator must also confirm the peer's possession of private key by using any method specified in Section 6.4.2.3 of SP 800-56Br2.

2.7.9 Key Transport and Key Agreement

The module does not establish SSPs using an approved key transport scheme (KTS). However, it does offer approved authenticated algorithms that can be used by an external operator/application as part of an approved KTS.

The module does not establish SSPs using an approved key agreement scheme (KAS). However, it does offer some or all of the underlying KAS cryptographic functionality to be used by an external operator/application as part of an approved KAS.

2.7.10 SHA-1 Use

SHA-1 is only approved when used in approved modes for message digest, HMAC, HKDF, KDA OneStep/TwoStep, PBKDF, SSH KDF, ANS x9.42 KDF, KBKDF, Hash DRBG, HMAC DRBG, RSA OAEP. The use of SHA-1 for digital signature generation (e.g., ECDSA, RSA, EdDSA) or verification is non-approved.

2.8 RBG and Entropy

Cert Number	Vendor Name
E177	SUSE LLC

Table 10: Entropy Certificates

Name	Type	Operational Environment	Sample Size	Entropy per Sample	Conditioning Component
SUSE OpenSSL CPU Time Jitter RNG Entropy Source	Non-Physical	SUSE Linux Enterprise Server 15 SP6 on AMD EPYCTM 7343; SUSE Linux Enterprise Server 15 SP6 on Ampere® Altra® Q80-30; SUSE Linux Enterprise Server 15 SP6 on Intel® Xeon® Gold 5416S; SUSE Linux Enterprise Server 15 SP6 on IBM® TelumTM	256 bits	full entropy	AES-256-CTR-DRBG (A5397); SHA3-256 (A5411)

Table 11: Entropy Sources

As per the Public document of entropy certificate E177, the entropy source provides full entropy of 256 bits.

In addition to the DRBG algorithms provided to the operator, the module internally uses two dedicated DRBG instances based on SP 800-90A Rev. 1 to generate seeds for asymmetric key pairs and random numbers for security functions. The following parameters are used:

1. Private DRBG: AES-256 CTR_DRBG with derivation function. This DRBG is used to generate secret random values (e.g. during asymmetric key pair generation). It can be accessed using RAND_priv_bytes.
2. Public DRBG: AES-256 CTR_DRBG with derivation function. This DRBG is used to generate general purpose random values that do not need to remain secret (e.g. initialization vectors). It can be accessed using RAND_bytes.

2.9 Key Generation

The module implements asymmetric key pair generation compliant with SP 800-133 Rev. 2 as listed in the Security Function Implementations table in 2.6 Security Function Implementations.

When random values are required, they are obtained from the SP 800-90A Rev. 1 approved DRBG, compliant with Section 4 of SP 800-133 Rev. 2 (without XOR).

Intermediate key generation values are not output from the module and are explicitly zeroized after processing the service.

2.10 Key Establishment

The module provides Diffie-Hellman (DH) and Elliptic Curve Diffie-Hellman (ECDH) shared secret computation compliant with SP 800-56A Rev. 3, in accordance with scenario 2 (1) of FIPS 140-3 IG D.F.

For Diffie-Hellman, the module supports the use of the safe primes defined in RFC 3526 (IKE) and RFC 7919 (TLS). Note that the module only implements key pair generation, key pair verification, and shared secret computation. No other part of the IKE or TLS protocols is implemented (with the exception of the TLS 1.2 and 1.3 KDFs):

- IKE (RFC 3526):
  - MODP-2048 (ID = 14)
  - MODP-3072 (ID = 15)
  - MODP-4096 (ID = 16)
  - MODP-6144 (ID = 17)
  - MODP-8192 (ID = 18)
- TLS (RFC 7919)
  - ffdhe2048 (ID = 256)
  - ffdhe3072 (ID = 257)
  - ffdhe4096 (ID = 258)

- ffdhe6144 (ID = 259)
- ffdhe8192 (ID = 260)

For Elliptic Curve Diffie-Hellman, the module supports the NIST-defined P-224, P-256, P-384, and P-521 curve.

According to FIPS 140-3 IG D.B, the key sizes of DH and ECDH shared secret computation provide respectively 112-200 and 112-256 bits of security strength in an approved mode of operation.

In addition, the module provides RSA shared secret computation compliant with SP 800-56B Rev. 2, in accordance with scenario 1 (1) of FIPS 140-3 IG D.F.

For RSA key generation, the module provides 2048-15360 bits keys. Therefore, according to FIPS 140-3 IG D.B, the key sizes of RSA shared secret computation provide 112-256 bits of security strength in the approved mode of operation.

2.11 Industry Protocols

The module implements the SSH key derivation function for use in the SSH protocol (RFC 4253 and RFC 6668).

GCM with internal IV generation in the approved mode is compliant with versions 1.2 and 1.3 of the TLS protocol (RFC 5288 and 8446) and shall only be used in conjunction with the TLS protocol. Additionally, the module implements the TLS 1.2 and TLS 1.3 key derivation functions for use in the TLS protocol.

No parts of the SSH, TLS, or IKE protocols, other than those mentioned above, have been tested by the CAVP and CMVP.

3 Cryptographic Module Interfaces

3.1 Ports and Interfaces

Physical Port	Logical Interface(s)	Data That Passes
N/A	Data Input	API input parameters
N/A	Data Output	API output parameters
N/A	Control Input	API function calls
N/A	Status Output	API return codes, error queue

Table 12: Ports and Interfaces

The logical interfaces are the APIs through which the applications request services. These logical interfaces are logically separated from each other by the API design. The module does not implement a control output interface.

4 Roles, Services, and Authentication

4.1 Authentication Methods

N/A for this module.

The module does not support authentication methods.

4.2 Roles

Name	Type	Operator Type	Authentication Methods
Crypto Officer	Role	CO	None

Table 13: Roles

The module supports the Crypto Officer role only. This sole role is implicitly and always assumed by the operator of the module when performing a service. The module does not support multiple concurrent operators.

4.3 Approved Services

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Symmetric Encryption	Used to perform symmetric encryption of an entry plaintext	EVP_EncryptFinal_ex returns 1	Plaintext, AES key, IV	Ciphertext	Symmetric Encryption with AES	Crypto Officer - AES key: W,E
Symmetric Decryption	Used to perform symmetric decryption of an entry ciphertext	EVP_DecryptFinal_ex returns 1	Ciphertext, AES key, IV	Plaintext	Symmetric Decryption with AES	Crypto Officer - AES key: W,E
Authenticated Encryption	Used to perform authenticated symmetr	AES-GCM: EVP_CIPHER_SUSE_FIPS_INDICATOR_APPROVED; Others: EVP_EncryptFinal_ex returns 1	Plaintext, AES key, IV	Ciphertext, MAC tag	Authenticated Symmetric	Crypto Officer - AES

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
	ic encryption with AES				Encryption	key: W,E
Authenticated Decryption	Used to perform authenticated symmetric decryption with AES	AES-GCM: EVP_CIPHER_SUSE_FIPS_INDICATOR_APPROVED; Others: EVP_DecryptFinal_ex returns 1	Ciphertext, AES key, IV, MAC tag	Plaintext or failure	Authenticated Symmetric Decryption	Crypto Officer - AES key: W,E
Message Authentication Code	Compute a MAC tag	HMAC: EVP_MAC_SUSE_FIPS_INDICATOR_APPROVED; Others: EVP_MAC_final returns 1	Message, AES key or HMAC key	MAC tag	Message Authentication Code	Crypto Officer - HMAC key: W,E - AES key: W,E
Message Digest	Used to generate a SHA-1, SHA-2, or SHA-3/SHAKE message digest	EVP_DigestFinal_ex returns 1	Message	Message digest	Message digest	Crypto Officer
Key Derivation with KBKDF	Derive a key from a key-derivation key	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Key-derivation key	KBKDF Derived Key	Key Derivation with KBKDF	Crypto Officer - Key Derivation Key: W,E - KBKDF

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
						Derived Key: G,R
Key Derivation with HKDF	Derive a key from a shared secret using HKDF	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	HKDF Derived Key	Key Derivation with HKDF	Crypto Officer - Shared Secret: W,E - HKDF Derived Key: G,R
Key Derivation with SSH KDF	Derive a key from a shared secret using SSH KDF	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	SSH Derived Key	Key Derivation with SSH KDF	Crypto Officer - Shared Secret: W,E - SSH Derived Key: G,R
Key Derivation with X9.63 KDF	Derive a key from a shared secret using X9.63 KDF	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	X9.63 Derived Key	Key Derivation with X9.63 KDF	Crypto Officer - Shared Secret: W,E - X9.63 Derived Key: G,R
Key Derivation with X9.42 KDF	Derive a key from a shared secret using X9.63 KDF	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	X9.42 Derived Key	Key Derivation with X9.42 KDF	Crypto Officer - Shared Secret: W,E - X9.42 Derived Key: G,R

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Key Derivation with KDA OneStep	Derive a key from a shared secret using KDA OneStep	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	KDA OneStep Derived Key	Key Derivation with KDA OneStep	Crypto Officer - Shared Secret: W,E - KDA OneStep Derived Key: G,R
Key Derivation with KDA TwoStep	Derive a key from a shared secret using KDA TwoStep	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	KDA TwoStep Derived Key	Key Derivation with KDA TwoStep	Crypto Officer - Shared Secret: W,E - KDA TwoStep Derived Key: G,R
TLS Key Derivation	Derive a key from a shared secret using TLS 1.2 KDF / TLS 1.3 KDF	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Shared secret	TLS Derived Key	TLS Key Derivation	Crypto Officer - Shared Secret: W,E - TLS Derived Key: G,R
Password-based Key Derivation	Derive a key from a password	EVP_KDF_SUSE_FIPS_INDICATOR_APPROVED	Password or passphrase	PBKDF Derived Key	Password-based Key Derivation	Crypto Officer - Password or passphrase: W,E -

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
						PBKDF Derived Key: G,R
Shared Secret Computation with DH	Compute a shared secret	EVP_PKEY_derive returns 1	DH private key, DH public key (peer)	Shared secret	Shared Secret Computation with DH	Crypto Officer - DH Private key: W,E - DH Public key: W,E - Shared Secret: G,R
Shared Secret Computation with ECDH	Compute a shared secret	EVP_PKEY_derive returns 1	EC private key, EC public key (peer)	Shared secret	Shared Secret Computation with ECDH	Crypto Officer - EC Private key: W,E - EC Public key: W,E - Shared Secret: G,R
Shared Secret Computation with RSA	Compute a shared secret	EVP_PKEY_derive returns 1	RSA private key, RSA public key (peer)	Shared secret	Shared Secret Computation with RSA	Crypto Officer - RSA private key: W,E - RSA public key: W,E - Shared

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access

Table 14: Approved Services

The module provides services to operators that assume the available role. All services are described in detail in the API documentation (manual pages). The convention below applies when specifying the access permissions (types) that the service has for each SSP.

- **Generate (G)**: The module generates or derives the SSP.
- **Read (R)**: The SSP is read from the module (e.g. the SSP is output).
- **Write (W)**: The SSP is updated, imported, or written to the module.
- **Execute (E)**: The module uses the SSP in performing a cryptographic operation.
- **Zeroize (Z)**: The module zeroizes the SSP.
- **N/A**: The module does not access any SSP or key during its operation.

To interact with the module, a calling application must use the EVP API layer provided by OpenSSL. This layer will delegate the request to the FIPS provider, which will in turn perform the requested service. Additionally, this EVP API layer can be used to retrieve the approved service indicator for the module. The suse_ossl_query_fipsindicator() function indicates whether an EVP API function is approved. After a cryptographic service was performed by the module, the API context (listed in the left column of the table below) associated with this request can contain a parameter (listed in the left right column of the table below) which represents the approved service indicator.

The exact process to use this function and how to interpret its results is described in the fips_module_indicators manual page.

Context	Service Indicator
EVP_CIPHER_CTX	OSSL_CIPHER_PARAM_SUSE_FIPS_INDICATOR
EVP_MAC_CTX	OSSL_MAC_PARAM_SUSE_FIPS_INDICATOR
EVP_KDF_CTX	OSSL_KDF_PARAM_SUSE_FIPS_INDICATOR
EVP_PKEY_CTX	OSSL_SIGNATURE_PARAM_SUSE_FIPS_INDICATOR

Table 15 - Service Indicator Parameters

4.4 Non-Approved Services

Name	Description	Algorithms	Role
AES GCM (external IV)	Authenticated Encryption	AES GCM (external IV)	CO

Name	Description	Algorithms	Role
HMAC (< 112-bit keys)	Compute a MAC tag	HMAC (< 112-bit keys)	CO
Key derivation	Derive a key from a key-derivation key or a shared secret	KBKDF, KDA OneStep, KDA TwoStep, HKDF, ANS X9.42 KDF, ANS X9.63 KDF (< 112-bit keys) KDA OneStep, KDA TwoStep (SHAKE128, SHAKE256) ANS X9.42 KDF (SHAKE128, SHAKE256) ANS X9.63 KDF (SHA-1, SHAKE128, SHAKE256) SSH KDF (SHA-512/224, SHA-512/256, SHA-3, SHAKE128, SHAKE256) TLS 1.2 KDF (SHA-1, SHA-224, SHA-512/224, SHA-512/256, SHA-3) TLS 1.3 KDF (SHA-1, SHA-224, SHA-512, SHA-512/224, SHA-512/256, SHA-3)	CO
PBKDF2 (< 112-bit keys)	Derive a key from a password	PBKDF2 (< 8 characters password; < 128 salt length; < 1000 iterations; < 112-bit keys)	CO
Signature generation	Generate a signature	RSA and ECDSA (pre-hashed message) RSA-PSS (invalid salt length: FIPS 186-5, section 5.4, item(g))	CO
Signature verification	Verify a signature	RSA and ECDSA (pre-hashed message) RSA-PSS (invalid salt length: FIPS 186-5, section 5.4, item(g))	CO

Table 16: Non-Approved Services

The table above lists the non-approved services in this module, the algorithms involved and the roles that can request the service. In this table, CO specifies the Crypto Officer role.

4.5 External Software/Firmware Loaded

The module does not load external software or firmware.

5 Software/Firmware Security

5.1 Integrity Techniques

The integrity of the module is verified by comparing a HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time. The module performs a KAT for the HMAC SHA-256 algorithm in order to test its proper operation before performing the checksum of the fips.so file.

5.2 Initiate on Demand

Integrity tests are performed as part of the pre-operational self-tests, which are executed when the module is initialized. The integrity test may be invoked on-demand by unloading and subsequently re-initializing the module, or by calling the OSSL_PROVIDER_self_test function. This will perform (among others) the software integrity test.

6 Operational Environment

6.1 Operational Environment Type and Requirements

Type of Operational Environment: Modifiable

How Requirements are Satisfied:

Any SSPs contained within the module are protected by the process isolation and memory separation mechanisms, and only the module has control over these SSPs.

6.2 Configuration Settings and Restrictions

The module shall be installed as stated in Section 11 Life-Cycle Assurance. If properly installed, the operating system provides process isolation and memory protection mechanisms that ensure appropriate separation for memory access among the processes on the system. Each process has control over its own data and uncontrolled access to the data of other processes is prevented.

Instrumentation tools like the ptrace system call, gdb and strace, userspace live patching, as well as other tracing mechanisms offered by the Linux environment such as ftrace or systemtap, shall not be used in the operational environment. The use of any of these tools implies that the cryptographic module is running in a non-validated operational environment.

7 Physical Security

The module is comprised of software only and therefore this Section is Not Applicable (N/A).

8 Non-Invasive Security

This module does not implement any non-invasive security mechanism, and therefore this Section is not applicable.

9 Sensitive Security Parameters Management

9.1 Storage Areas

Storage Area Name	Description	Persistence Type
RAM	Temporary storage for SSPs used by the module as part of service execution. SSPs are stored until they are zeroized by the operator (using a zeroization call or removing power from the module) or zeroized automatically	Dynamic

Table 17: Storage Areas

The module does not perform persistent storage of SSPs. The SSPs are temporarily stored in the RAM in plaintext form.

9.2 SSP Input-Output Methods

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
API input parameters	Operator calling application (TOEPP)	Cryptographic module	Plaintext	Manual	Electronic	
API output parameters	Cryptographic module	Operator calling application (TOEPP)	Plaintext	Manual	Electronic	

Table 18: SSP Input-Output Methods

The module only supports SSP entry and output to and from the calling application running on the same operational environment. This corresponds to manual distribution, electronic entry/output (“CM Software to/from App via TOEPP Path”) per FIPS 140-3 IG 9.5.A Table 1.

There is no entry or output of cryptographically protected SSPs.

9.3 SSP Zeroization Methods

Zeroization Method	Description	Rationale	Operator Initiation
Free cipher handle	Zeroizes the SSPs contained within the cipher handle.	By calling the appropriate zeroization functions: AES key: EVP_CIPHER_CTX_free and EVP_MAC_CTX_free; HMAC key: EVP_MAC_CTX_free; Key-derivation key:	By calling the cipher related zeroization API

Zeroization Method	Description	Rationale	Operator Initiation
		EVP_KDF_CTX_free; Shared secret: EVP_KDF_CTX_free; Password: EVP_KDF_CTX_free; KBKDF Derived Key: EVP_KDF_CTX_free; HKDF Derived Key: EVP_KDF_CTX_free; TLS Derived Key: EVP_KDF_CTX_free; SSH Derived Key: EVP_KDF_CTX_free; X9.63 Derived Key: EVP_KDF_CTX_free; X9.42 Derived Key: EVP_KDF_CTX_free; PBKDF Derived Key: EVP_KDF_CTX_free; KDA OneStep Derived Key: EVP_KDF_CTX_free; KDA TwoStep Derived Key: EVP_KDF_CTX_free; Entropy input: EVP_RAND_CTX_free; DRBG internal state (V value, Key), DRBG internal state (V value, C value): EVP_RAND_CTX_free; DH public & private key: EVP_PKEY_free; EC public & private key: EVP_PKEY_free; RSA public & private key: EVP_PKEY_free	
Automatic	Automatically zeroized by the module when no longer needed	Memory occupied by SSPs is overwritten with zeroes, which renders the SSP values irretrievable.	N/A
Module Reset	De-allocates the volatile memory used to store SSPs	Volatile memory used by the module is overwritten within nanoseconds when power is removed.	By unloading and reloading the module

Table 19: SSP Zeroization Methods

The application that uses the module is responsible for the appropriate zeroization of SSPs. The module provides key allocation and destruction functions, which overwrites the memory occupied by the SSP´s information with zeroes before its deallocation.

Memory allocation of SSPs is performed by the OPENSSL_malloc() API call and the application in use of the module is responsible for the calling of the appropriate zeroization functions from the OpenSSL API. The zeroization functions then overwrite the memory occupied by SSPs and de-allocate the memory with the OPENSSL_free() call. OPENSSL_cleanse() should be used to overwrite sensitive data such as private keys.

All data output is inhibited during zeroization.

9.4 SSPs

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
AES key	AES key used for encryption, decryption, and computing MAC tags	AES-XTS: 256, 512 bits; Other modes: 128, 192, 256 bits - AES-XTS: 128, 256 bits; Other modes: 128, 192, 256 bits	Symmetric key - CSP			Symmetric Encryption with AES Symmetric Decryption with AES Authenticated Symmetric Encryption Authenticated Symmetric Decryption
HMAC key	HMAC key used for computing MAC tags	112-524288 bits - 112-256 bits	Symmetric key - CSP			Message Authentication Code
Module-generated RSA private key	RSA private key generated by the module	2048-15360 bits - 112-256 bits	Private key - CSP	Key Pair Generation with RSA		Key Pair Generation with RSA
Module-generated RSA public key	RSA public key generated by the module	2048-15360 bits - Key pair generation: 112-256 bits	Public key - PSP	Key Pair Generation with RSA		Key Pair Generation with RSA
RSA private key	RSA private key written to the module	2048-16384 bits - 112-256 bits	Private key - CSP			Signature Generation Shared Secret Computation with RSA Asymmetric Decryption with RSA
RSA public key	RSA public key written to the module	Signature verification: 1024-16384 bits; Others: 2048-16384 bits -	Public key - PSP			Signature Verification Shared Secret Computation with RSA Asymmetric

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
		Signature verification: 80-256 bits; Others: 112-256 bits				Encryption with RSA
Module-generated DH Private key	DH Private key generated by the module	2048-8192 bits - 112-200 bits	Private key - CSP	Key Pair Generation with Safe Primes		Key Pair Generation with Safe Primes
Module-generated DH Public key	DH Public key generated by the module	2048-8192 bits - 112-200 bits	Public key - PSP	Key Pair Generation with Safe Primes		Key Pair Generation with Safe Primes
DH Private key	DH Private key written to the module	2048-8192 bits - 112-200 bits	Private key - CSP			Shared Secret Computation with DH Key Pair Verification with Safe Primes
DH Public key	DH Public key written to the module	2048-8192 bits - 112-200 bits	Public key - PSP			Shared Secret Computation with DH Key Pair Verification with Safe Primes
Module-generated EC Private key	EC Private key generated by the module	P-224, P-256, P-384, P-521 bits - 112, 128, 192, 256 bits	Private key - CSP	Key Pair Generation with ECDSA		Key Pair Generation with ECDSA
Module-generated EC Public key	EC Public key generated by the module	P-224, P-256, P-384, P-521 bits - 112,	Public key - PSP	Key Pair Generation with ECDSA		Key Pair Generation with ECDSA

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
		128, 192, 256 bits				
EC Private key	EC Private key written the module and used by ECDSA and ECDH	P-224, P-256, P-384, P-521 bits - 112, 128, 192, 256 bits	Private key - CSP			Shared Secret Computation with ECDH Signature Generation Key Pair Verification with ECDSA
EC Public key	EC Public key written the module and used by ECDSA and ECDH	P-224, P-256, P-384, P-521 bits - 112, 128, 192, 256 bits	Public key - PSP			Signature Verification Shared Secret Computation with ECDH Key Pair Verification with ECDSA
Key Derivation Key	Symmetric key used to derive symmetric keys	112-4096 bits - 112-256 bits	Symmetric key - CSP			Key Derivation with KBKDF
KBKDF Derived Key	Symmetric key derived from a key-derivation key	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with KBKDF		Key Derivation with KBKDF
HKDF Derived Key	Symmetric key derived from a shared secret	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with HKDF		Key Derivation with HKDF
SSH Derived Key	Symmetric key derived from a shared secret	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with SSH KDF		Key Derivation with SSH KDF
X9.63 Derived Key	Symmetric key derived from a shared secret	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with		Key Derivation with X9.63 KDF

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
				X9.63 KDF		
X9.42 Derived Key	Symmetric key derived from a shared secret	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with X9.42 KDF		Key Derivation with X9.42 KDF
Password or passphrase	Password or passphrase used by PBKDF to derive symmetric keys	8-128 characters - N/A	Password - CSP			Password-based Key Derivation
PBKDF Derived Key	Key derived from PBKDF password/passphrase during key derivation	112-4096 bits - 112-256 bits	Symmetric key - CSP	Password-based Key Derivation		Password-based Key Derivation
KDA OneStep Derived Key	Symmetric key derived from a shared secret	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with KDA OneStep		Key Derivation with KDA OneStep
KDA TwoStep Derived Key	Symmetric key derived from a shared secret	112-4096 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with KDA TwoStep		Key Derivation with KDA TwoStep
TLS Derived Key	Derived key used in Transport Layer Security (TLS) network protocol	112-4096 bits - 112-256 bits	Symmetric key - CSP	TLS Key Derivation		
Shared Secret	Shared secret generated by ECDH/DH/RSA shared secret computation	224-8912 bits - 112-256 bits	Shared Secret - CSP		Shared Secret Computation with DH Shared Secret Computation with	Key Derivation with KDA OneStep Key Derivation with KDA TwoStep

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
					ECDH Shared Secret Computation with RSA	Key Derivation with X9.42 KDF Key Derivation with X9.63 KDF Key Derivation with SSH KDF Key Derivation with HKDF Shared Secret Computation with DH Shared Secret Computation with ECDH Shared Secret Computation with RSA
Entropy input	Entropy input string used to seed the DRBG (IG D.L compliant)	128-384 bits - 128-256 bits	Entropy Input - CSP			Random Number Generation
DRBG seed	DRBG seed derived from entropy input (IG D.L compliant)	CTR_DRBG: 256, 320, 384 bits; Hash_DRBG: 440, 888 bits; HMAC_DRBG: 160, 256, 512 bits - CTR_DRBG: 128, 192, 256 bits; HMAC_DRBG,	Seed - CSP	Random Number Generation		Random Number Generation

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
		Hash_DRBG: 128, 256 bits				
DRBG internal state (V value, C value)	Internal state of the Hash_DRBG (IG D.L compliant)	880, 1776 bits - 128, 256 bits	Internal state - CSP	Random Number Generation		Random Number Generation
DRBG internal state (V value, Key)	Internal state of the CTR_DRBG and HMAC_DRBG (IG D.L compliant)	CTR_DRBG: 256, 320, 384 bits; HMAC_DRBG: 320, 512, 1024 bits - CTR_DRBG: 128, 192, 256 bits; HMAC_DRBG: 128, 256 bits	Internal state - CSP	Random Number Generation		Random Number Generation
Intermediate key generation value	Intermediate key pair generation value generated during key generation and key derivation services (SP 800-133 Rev. 2 Section 4, 5.1, and 5.2)	112-15360 bits - 112-256 bits	Intermediate value - CSP	Key Pair Generation with RSA Key Pair Generation with ECDSA Key Pair Generation with Safe Primes		Key Pair Generation with RSA Key Pair Generation with ECDSA Key Pair Generation with Safe Primes

Table 21: SSP Table 2

9.5 Transitions

The SHA-1 algorithm as implemented by the module will be non-approved for all purposes, starting January 1, 2031.

10 Self-Tests

10.1 Pre-Operational Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details
HMAC-SHA2-256 (A5868)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.
HMAC-SHA2-256 (A5864)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.
HMAC-SHA2-256 (A5876)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.
HMAC-SHA2-256 (A5877)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details
HMAC-SHA2-256 (A5878)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.
HMAC-SHA2-256 (A5879)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.
HMAC-SHA2-256 (A5883)	256-bits key	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.
HMAC-SHA2-256 (A5889)	256-bits key Message	Message authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test of the shared library component of the module. Verified by comparing an HMAC SHA-256 value calculated at run time with the HMAC SHA-256 value embedded in the fips.so file that was computed at build time.

Table 22: Pre-Operational Self-Tests

The pre-operational software integrity tests are performed automatically when the module is initialized, before the module transitions into the operational state. While the module is executing the self-tests, services are not

available, and data output (via the data output interface) is inhibited until the tests are successfully completed. The module transitions to the operational state only after the pre-operational self-tests are passed successfully.

Prior the first use, a CAST is executed for the algorithms used in the Pre-operational Self-Tests.

10.2 Conditional Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
SHA-1 (A5868)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA-1 (A5876)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA-1 (A5877)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA-1 (A5878)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA-1 (A5879)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA-1 (A5883)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA-1 (A5889)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA2-512 (A5868)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
						before the integrity test
SHA2-512 (A5876)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA2-512 (A5877)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA2-512 (A5878)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA2-512 (A5879)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA2-512 (A5883)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA2-512 (A5889)	24-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5864)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5868)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
HMAC-SHA2-256 (A5876)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5877)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5878)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5879)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5883)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
HMAC-SHA2-256 (A5889)	256-bit key	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA3-256 (A5869)	32-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
SHA3-256 (A5885)	32-bit message	KAT	CAST	Module becomes operational	Message digest	Test runs at power-on before the integrity test
AES-GCM (A5870)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
AES-GCM (A5871)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5872)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5873)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5874)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5875)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5880)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5881)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5882)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5886)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
AES-GCM (A5887)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5888)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5903)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5904)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-GCM (A5905)	256-bit key and 96-bit IV, encypt and decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5398)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5399)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5400)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5401)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
AES-ECB (A5402)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5403)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5658)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5884)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5893)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5894)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5895)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5896)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test
AES-ECB (A5900)	128-bit key, decrypt	KAT	CAST	Module becomes operational	Symmetric operation	Test runs at power-on before the integrity test

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
RSA SigGen (FIPS186-5) (A5868)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5869)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5876)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5877)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5878)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5879)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5883)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5885)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test
RSA SigGen (FIPS186-5) (A5889)	PKCS#1 v1.5 with SHA-256 and 2048-bit key	KAT	CAST	Module becomes operational	Digital signature generation	Test runs at power-on before the integrity test

Table 23: Conditional Self-Tests

Data output through the data output interface is inhibited during the conditional self-tests. The module does not return control to the calling application until the tests are completed. If any of these tests fails, the module transitions to the error state (Section 10.4 Error States).

10.3 Periodic Self-Test Information

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
HMAC-SHA2-256 (A5868)	Message authentication	SW/FW Integrity	On demand	Manually

Table 25: Conditional Periodic Information

10.4 Error States

Name	Description	Conditions	Recovery Method	Indicator
Error	If the module fails any of the self-tests, the module enters the error state. In the error state, the module immediately stops functioning and ends the application process	Software integrity test failure CAST failure	Module reinitialization	OSSL_PROV_PARAM_STATUS is set to 0. Module will not load.

Name	Description	Conditions	Recovery Method	Indicator
PCT Error	Pairwise consistency test failure	PCT failure	Module reinitialization	Module is aborted

Table 26: Error States

If the module fails any of the self-tests, the module enters the error state. In the error state, the module immediately stops functioning and ends the application process. Consequently, the data output interface is inhibited, and the module no longer accepts inputs or requests (as the module is no longer running).

10.5 Operator Initiation of Self-Tests

Both conditional and pre-operational self-tests can be executed on-demand by unloading and subsequently re-initializing the module, or by calling the OSSL_PROVIDER_self_test function. The pair-wise consistency tests can be invoked on demand by requesting the key pair generation service.

11 Life-Cycle Assurance

11.1 Installation, Initialization, and Startup Procedures

The module is distributed as a part of the SUSE Linux Enterprise 15 SP6 OpenSSL package in the form of the libopenssl-3-fips-provider-3.1.4-150600.5.15.1 RPM package.

Before the libopenssl-3-fips-provider-3.1.4-150600.5.15.1 RPM package is installed, the SUSE Linux Enterprise 15 SP6 system must operate in the FIPS validated configuration.

To do so the following steps shall be performed with the root privilege:

1. Install the needed crypto-policies scripts:

```
# zypper in crypto-policies-scripts
```

2. Set FIPS validated crypto-policies :

```
# update-crypto-policies --set FIPS
```

3. Append the following parameter in the /etc/default/grub configuration file in the GRUB_CMDLINE_LINUX_DEFAULT line:

```
fips=1
```

4. After editing the configuration file, please run the following command to change the setting in the UEFI and BIOS boot loaders:

```
# grub2-mkconfig -o /boot/efi/EFI/sles/grub.cfg
# grub2-mkconfig -o /boot/grub2/grub.cfg
```

If /boot or /boot/efi resides on a separate partition, the kernel parameter boot=<partition of /boot or /boot/efi> must be supplied. The partition can be identified with the command "df /boot" or "df /boot/efi" respectively. For example:

```
# df /boot
Filesystem     1K-blocks     Used     Available     Use%     Mounted on
/dev/sda1      233191        30454    190296        14%      /boot
```

The partition of /boot is located on /dev/sda1 in this example. Therefore, the following string needs to be appended in the aforementioned grub file:

```
"boot=/dev/sda1"
```

5. Reboot to apply these settings.

Now, the operating environment is configured to support the approved mode of operation. The Crypto Officer should check the existence of the file /proc/sys/crypto/fips_enabled, and verify it contains a numeric value “1”. If the file does not exist or does not contain “1”, the operating environment is not configured to support the approved mode of operation and the module will not operate as a FIPS validated module properly.

11.2 Administrator Guidance

After the libopenssl-3-fips-provider-3.1.4-150600.5.15.1 RPM package is installed, the Crypto Officer must execute the openssl list --providers command. This command should display the base/default and FIPS providers as follows:

```
Providers
base
        name: OpenSSL Base Provider
        version: 3.1.4
        status: active
default
        name: OpenSSL Default Provider
        version: 3.1.4
        status: active
fips
        name: SUSE Linux Enterprise - OpenSSL FIPS Provider
        version: 3.1.4 SUSE release 150600.5.15.1
        status: active
```

The cryptographic boundary consists only of the FIPS provider as listed. If any other OpenSSL or third-party provider is invoked, the user is not interacting with the module specified in this Security Policy.

11.3 Non-Administrator Guidance

There is no Non-Administrator Guidance.

11.4 End of Life

As the module does not persistently store SSPs, secure sanitization of the module consists of unloading the module. This will zeroize all SSPs in volatile memory. Then, if desired, the libopenssl-3-fips-provider-3.1.4-150600.5.15.1 RPM package can be uninstalled from the SUSE Linux Enterprise 15 SP6 system.

12 Mitigation of Other Attacks

12.1 Attack List

Certain cryptographic subroutines and algorithms are vulnerable to timing analysis. The module claims mitigation of timing-based side-channel attacks implementing two methods, Constant-time Implementations and Numeric Blinding:

- Constant-time Implementations protect cryptographic implementations in the module against timing cryptanalysis ensuring that the variations in execution time for different cryptographic algorithms cannot be traced back to the key, CSP or secret data.
- Numeric Blinding protects the RSA and ECDSA algorithms from timing attacks. These algorithms are vulnerable to such attacks since attackers can measure the time of signature operations or RSA decryption. To mitigate this, the module generates a random factor which is provided as an input to the decryption/signature operation which discarded once the operation results in an output. This makes it difficult for attackers to attempt timing attacks making impossible correlating execution time to the RSA/ECDSA key.

Appendix A. Glossary and Abbreviations

AES	Advanced Encryption Standard
API	Application Programming Interface
CAST	Cryptographic Algorithm Self-Test
CAVP	Cryptographic Algorithm Validation Program
CBC	Cipher Block Chaining
CCM	Counter with Cipher Block Chaining-Message Authentication Code
CFB	Cipher Feedback
CKG	Cryptographic Key Generation
CMAC	Cipher-based Message Authentication Code
CMVP	Cryptographic Module Validation Program
CSP	Critical Security Parameter
CTR	Counter
DH	Diffie-Hellman
DRBG	Deterministic Random Bit Generator
ECB	Electronic Code Book
ECC	Elliptic Curve Cryptography
ECDH	Elliptic Curve Diffie-Hellman
ECDSA	Elliptic Curve Digital Signature Algorithm
EVP	Envelope
FFC	Finite Field Cryptography
FIPS	Federal Information Processing Standards
GCM	Galois Counter Mode
GMAC	Galois Counter Mode Message Authentication Code
HKDF	HMAC-based Key Derivation Function
HMAC	Keyed-Hash Message Authentication Code
IKE	Internet Key Exchange
KAS	Key Agreement Scheme
KAT	Known Answer Test
KBKDF	Key-based Key Derivation Function
KW	Key Wrap
KWP	Key Wrap with Padding
MAC	Message Authentication Code
NIST	National Institute of Science and Technology
OFB	Output Feedback
PAA	Processor Algorithm Acceleration
PCT	Pair-wise Consistency Test

PBKDF2	Password-based Key Derivation Function v2
PSS	Probabilistic Signature Scheme
RSA	Rivest, Shamir, Adleman
SHA	Secure Hash Algorithm
SSC	Shared Secret Computation
SSH	Secure Shell
SSP	Sensitive Security Parameter
TLS	Transport Layer Security
XOF	Extendable Output Function
XTS	XEX-based Tweaked-codebook mode with cipher text Stealing
