List of Figures

1 General

1.1 Overview

This document is the non-proprietary FIPS 140-3 Security Policy for Hardware version 3.0.7 / 3.0.8 of the Nuvoton Cryptographic Library 3.0. It has a one-to-one mapping to the [SP 800-140Br1] starting with section B.2.1 named “General” that maps to section 1 in this document and ending with section B.2.12 named “Mitigation of other attacks” that maps to section 12 in this document. This document also contains the security rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-3 (Federal Information Processing Standards Publication 140-3) for a Security Level 1 module.

1.2 Security Levels

Table 1 describes the individual security areas of FIPS 140-3, as well as the Security Levels of those individual areas:

Section	Title	Security Level
1	General	1
2	Cryptographic module specification	1
3	Cryptographic module interfaces	1
4	Roles, services, and authentication	1
5	Software/Firmware security	N/A
6	Operational environment	N/A
7	Physical security	2
8	Non-invasive security	N/A
9	Sensitive security parameter management	1
10	Self-tests	1
11	Life-cycle assurance	1
12	Mitigation of other attacks	N/A
	Overall Level	1

Table 1: Security Levels

2 Cryptographic Module Specification

2.1 Description

Purpose and Use:

The Nuvoton Cryptographic Library 3.0 cryptographic module (hereafter referred to as “the module”) is a Hardware Single Chip cryptographic module. More specifically, the module is considered a sub-chip cryptographic subsystem as defined in IG 2.3.B.

Module Type: Hardware
Module Embodiment: SingleChip
Module Characteristics: SubChip

Cryptographic Boundary:

The block diagram below shows the cryptographic boundary of the module (shown by the blue dotted outline), and its interfaces with the operational environment.

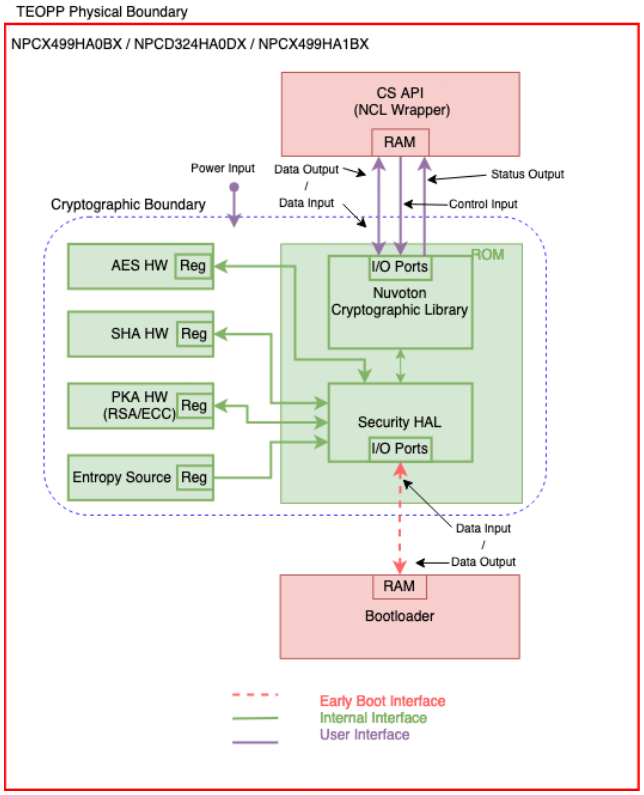

Figure 1: Block Diagram

Tested Operational Environment’s Physical Perimeter (TOEPP):

The red outline in Figure 1 above indicates the Tested Operational Environment’s Physical Perimeter (TOEPP).

Figure 2: Nuvoton NPCD324HA0DX (SIO)

Figure 3: Nuvoton NPCX499HA0BX (EC)

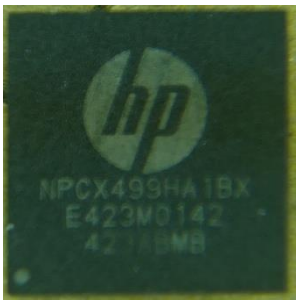

Figure 4: Nuvoton NPCX499HA1BX (EC)

2.2 Tested and Vendor Affirmed Module Version and Identification

Tested Module Identification – Hardware:

Model and/or Part Number	Hardware Version	Firmware Version	Processors	Features
Nuvoton NPCX499HA0BX	3.0.7	N/A	N/A	Notebook Embedded Controller (EC)
Nuvoton NPCD324HA0DX	3.0.8	N/A	N/A	Desktop Super I/O (SIO)
Nuvoton NPCX499HA1BX	3.0.8	N/A	N/A	Notebook Embedded Controller (EC)

Table 2: Tested Module Identification – Hardware

2.3 Excluded Components

There are no components within the cryptographic boundary excluded from the FIPS 140-3 requirements.

2.4 Modes of Operation

Modes List and Description:

The module supports approved services in the approved mode of operation. There are no non-approved services supported by the module.

Mode Name	Description	Type	Status Indicator
Approved Mode	Only approved algorithms are used	Approved	NCL_STATUS_OK

Table 3: Modes List and Description

2.5 Algorithms

Approved Algorithms:

The table below lists all security functions of the module, including specific key strengths employed for approved services, and implemented modes of operation.

Algorithm	CAVP Cert	Properties	Reference
AES-CBC	A4659	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-CBC	A5276	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-CCM	A4659	Key Length - 128, 192, 256	SP 800-38C
AES-CCM	A5276	Key Length - 128, 192, 256	SP 800-38C

Table 6: Security Function Implementations

2.7 Algorithm Specific Information

The module's AES-GCM implementation conforms to IG C.H scenario 2. The module uses the approved Hash_DRBG to generate the IV with a length of 96-bits. The entropy source producing the DRBG seed is located inside the module's cryptographic boundary.

Steps to comply with the SP800-56Brev2 assurances can be found in section 11.3 Non-Administrator Guidance.

The module does not establish SSPs using an approved key transport scheme (KTS). However, it does offer approved authenticated algorithms that can be used by an external operator/application as part of an approved KTS.

2.8 RBG and Entropy

The module employs a Hash_DRBG using a SHA-512 PRF. Per section 10.1.1.1 of [SP800-90A], the internal state of the Hash_DRBG is the V, C, and reseed counter. The module makes use of the GetEntropy() interface of the entropy source to make two independent calls that output 512-bit each of full entropy from the SP 800-90B entropy source then concatenating them together to form 1024-bits of entropy input for the DRBG. The Hash_DRBG can generate random numbers with up to 256-bits of security strength. The DRBG internal state is not accessible by non-DRBG functions. All random values used by approved security functions, SSP generation, or SSP establishment method are provided by the Hash_DRBG.

Cert Number	Vendor Name
E161	Nuvoton

Table 7: Entropy Certificates

Name	Type	Operational Environment	Sample Size	Entropy per Sample	Conditioning Component
Nuvoton NTCES03	Physical	NPCX499HA0BX, NPCX499HA1BX, NPCD324HA0DX	512 bits	512 bits	The entropy pool is filled with random bits provided by an SP800-90B compliant entropy source whose noise source is from Ring Oscillators in hardware. SHA2-512 is used as the conditioning component with CAVP certs# A4659 and A5276.

Table 8: Entropy Sources

2.9 Key Generation

The module generates Keys and SSPs in accordance with FIPS 140-3 IG D.H. The cryptographic module performs Cryptographic Key Generation (CKG) for asymmetric keys as per [SP800-133rev2] (vendor affirmed), compliant with [FIPS186-5] and using DRBG compliant with [SP800-90Arev1]. A seed (i.e., the random value) used in asymmetric key generation is obtained from [SP800-90Arev1] DRBG as described in Section 4 example 1 of [SP800-133rev2], where V is a string of binary zeroes, meaning B = U (i.e., the output of an approved RBG). The key generation service for ECDSA, as well as the [SP 800-90Arev1] DRBG have been ACVT tested with algorithm certificates found in Table 3.

The module provides key derivation service using SP800-108 KBKDF.

2.10 Key Establishment

The module implements KAS-ECC-SSC EC Diffie-Hellman Shared Secret Computation compliant to [SP800-56Arev3] and IG D.F Scenario (2) path (1).

- The shared secret computation provides between 128 and 256 bits of encryption strength.

3 Cryptographic Module Interfaces

3.1 Ports and Interfaces

The underlying logical interfaces of the module are the module's C language Application Programming Interfaces (APIs). All data input and data output, status ports and control ports are directed through the interface of the module's logical component, which are the APIs while the physical interface is considered the I/O ports of the sub-chip module through which the data input and data output, status output and control input traverse.

Physical Port	Logical Interface(s)	Data That Passes
I/O Ports	Data Input	Data inputs are provided in the variables passed in the API and callable service invocations, generally through caller-supplied buffers.
I/O Ports	Data Output	Data outputs are provided in the variables passed in the API and callable service invocations, generally through caller-supplied buffers.
I/O Ports	Control Input	Control inputs which control the operation of the module are provided through dedicated parameters.
I/O Ports	Status Output	Status output is provided in return codes and through messages. Documentation for each API lists possible return codes. A complete list of all return codes returned by the C language APIs within the module is provided in the header files and the API documentation. Messages are documented also in the API documentation.
Power Port	Power	Power interface is provided internally by TEOPP in which the cryptographic module is embedded.

Table 9: Ports and Interfaces

The module does not implement a Control Output Interface.

4 Roles, Services, and Authentication

4.1 Authentication Methods

FIPS 140-3 does not require authentication mechanism for level 1 modules. Therefore, the module does not implement an authentication mechanism.

N/A for this module.

4.2 Roles

The module supports two authorized roles: A Crypto Officer Role and a User Role. No support is provided for a Maintenance operator. The module does not implement a bypass mode nor concurrent operators.

Name	Type	Operator Type	Authentication Methods
Crypto Officer	Role	CO	None
User	Role	User	None

Table 10: Roles

When a device is delivered, the Crypto Officer is responsible for initializing the module i.e., configure the device by properly setting up key registers for storage of keys/CSPs. The Crypto Officer is implicitly assumed. The User can perform services from Table 11 only after the Crypto Officer takes possession by initializing the module, thus creating data to be protected is generated. The Users of the module are software applications that implicitly assume the User Role when requesting any cryptographic services provided by the module.

4.3 Approved Services

The module only implements Approved security functions in an Approved mode. The Table 5 below lists services available. The module provides an approved service indicator by receiving a return code of “NCL_STATUS_OK to indicate that the service executed an approved security function.

NOTE: The module does not implement any non-Approved Algorithms in the Approved Mode of Operation (neither with nor without security claim). The module does not implement any non-approved security functions.

The abbreviations of the access rights to keys and SSPs have the following interpretation:

G = **Generate**: The module generates or derives the SSP.

R = **Read**: The SSP is read from the module (e.g., the SSP is output).

W = **Write**: The SSP is updated, imported, or written to the module.

E = **Execute**: The module uses the SSP in performing a cryptographic operation.

Z = **Zeroise**: The module zeroises the SSP.

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
AES Encryption	Data Encryption	NCL STATUS OK	AES key, plain text	cipher text	AES-CBC AES-CCM AES-CFB128 AES-CTR	User - AES key: W,E

Table 11: Approved Services

5 Software/Firmware Security

5.1 Integrity Techniques

The memory technology is non reconfigurable memory as defined in IG 5.A, which will not have any change or degradation of data for a minimum of 10 years after manufactured date. As such, it is considered a hardware only module with a non-modifiable operational environment. The requirements of this area are not applicable to the module.

6 Operational Environment

6.1 Operational Environment Type and Requirements

The Nuvoton Cryptographic Library 3.0 operates in a non-modifiable operational environment. The module is programmed by the manufacturer during the silicon manufacturing (rather than by the user). It maintains its own memory region which can only be accessed by the module. There is no additional application present within the operating environment. The module does not spawn any cryptographic processes.

Type of Operational Environment: Limited

7 Physical Security

7.1 Mechanisms and Actions Required

The Nuvoton Cryptographic Library 3.0 cryptographic module is a Hardware cryptographic module in a single chip embodiment. More specifically, the module is considered a sub-chip cryptographic subsystem.

The module consists of production-grade components that include standard passivation techniques (e.g., a conformal coating applied over the module's circuitry to protect against environmental or other physical damage). The module does not implement a maintenance role and has no maintenance access interface.

Mechanism	Inspection Frequency	Inspection Guidance
Hard tamper-evident coating	Determined by the operator	Observe the coating surrounding the chip for any signs of damage

Table 12: Mechanisms and Actions Required

8 Non-Invasive Security

Currently, the non-invasive security is not required by FIPS 140-3 (see NIST SP 800-140F). The requirements of this area are not applicable to the module.

9 Sensitive Security Parameters Management

9.1 Storage Areas

The module does not provide persistent storage for keys/SSPs. Keys/SSPs are stored in memory only and are received for use by the module only at the request of the User firmware.

Storage Area Name	Description	Persistence Type
RAM	Stored in volatile memory	Dynamic

Table 13: Storage Areas

9.2 SSP Input-Output Methods

Keys/SSPs entered or output the module are electronically entered in plaintext form from the invoking User firmware running on the same device. No Keys/SSPs are entered into or output from the module from outside of the TOEPP. According to IG 2.3.B, transferring SSPs including the entropy input between a sub-chip cryptographic subsystem and an intervening functional subsystem for Security Levels 1 and 2 on the same single chip is considered as not having Sensitive Security Parameter Establishment crossing the HMI of the sub-chip module per IG 9.5.A. Entropy input remains within the module's sub-chip boundary.

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
API input	Within the TOEPP	RAM	Plaintext	Automated	Electronic	
API output	RAM	Within the TOEPP	Plaintext	Automated	Electronic	

Table 14: SSP Input-Output Methods

9.3 SSP Zeroization Methods

Keys and SSPs are explicitly zeroized automatically prior to the structure associated with the cipher being deallocated or implicitly when the device is powered down thereby rendering the data irretrievable. Input and output interfaces are inhibited while zeroization is being performed. For Keys and SSPs explicitly zeroized automatically the successful completion of a requested service suffices as the implicit indicator that zeroisation has completed. Keys and SSPs may be zeroized explicitly by calling the respective NCL_<alg>_Clear API listed in the table below which immediately zeroizes all sensitive data.

Zeroization Method	Description	Rationale	Operator Initiation
Module Reset	Power cycles the module	All SSPs in memory are overwritten by zeros	Initiated by operator
Automatic zeroization	Automatic zeroization when when no longer needed	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Automatically by the module

Zeroization Method	Description	Rationale	Operator Initiation
NCL_SHA_Clear	Clears existing SHA, HMAC, KBKDF contexts	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Initiated by operator
NCL_DRBG_Clear	Clears existing DRBG contexts	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Initiated by operator
NCL_AES_Clear	Clears existing AES contexts	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Initiated by operator
NCL_RSA_Clear	Clears existing RSA contexts	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Initiated by operator
NCL_ECC_Clear	Clears existing ECDSA and ECDH contexts	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Initiated by operator
NCL_HSS_Clear	Clears existing HSS contexts	Overwrites the targeted SSP's contents in memory with zeros using memset/memset_s for any contents in RAM and REG_WRITE for any contents in hardware registers	Initiated by operator

Table 15: SSP Zeroization Methods

9.4 SSPs

The following summarizes the keys and Sensitive Security Parameters (SSPs) that are used by the cryptographic services implemented in the module. Modification of PSPs by unauthorized operators is prohibited.

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
AES key	AES Symmetric key used in Data Encryption, Data Decryption and Message Authentication Code Generation and verification	128, 192, 256 bits - 128, 192, 256 bits	Symmetric - CSP			AES-CBC AES-CCM AES-CFB128 AES-CMAC AES-CTR AES-ECB AES-GCM AES-GMAC

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
RSA Encapsulation Key	RSA OAEP private key	2048, 3072 bits - 112, 128 bits	Asymmetric - CSP			RSA encapsulation
RSA Decapsulation Key	RSA OAEP public key	2048, 3072 bits - 112, 128 bits	Asymmetric - PSP			RSA decapsulation
RSA Sig private key	Signature Generation	2048, 3072 bits - 112, 128 bits	Asymmetric - CSP			RSA SigGen
RSA Sig public key	Signature Verification	2048, 3072 bits - 112, 128 bits	Asymmetric - PSP			RSA SigVer

Table 17: SSP Table 2

10 Self-Tests

10.1 Pre-Operational Self-Tests

The module is solely implemented in hardware (i.e., only contains executable code that is stored in non- reconfigurable memory). As such, the module does not perform any pre-operational software/firmware integrity test, but instead performs a Cryptographic Algorithm Self-Test on the SHA2-256, HMAC- SHA2-512 and KBKDF-HMAC-SHA2-256 algorithms when the module is powered on.

Self-tests ensure that the module is not corrupted and that the cryptographic algorithms work as expected. While the module is executing the above self-tests, no services are available and input and output are inhibited. The module will boot only after successfully passing the SHA2-256, HMAC- SHA2-512 and KBKDF-HMAC-SHA2-256 CASTs. If an error is detected in any self-test, the module will enter the Error State.

N/A for this module.

The module does not implement a pre-operational bypass test nor pre-operational critical functions test.

10.2 Conditional Self-Tests

The module conducts conditional cryptographic algorithm self-test prior to the first operational use of each cryptographic algorithm. The table below describe the conditional tests supported by the module.

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
HMAC-SHA2-512 (A4659)	HMAC-SHA2-512 MAC Generation KAT	KAT	CAST	NCL STATUS OK	MAC Generation	Performed when the module is powered on
HMAC-SHA2-512 (A5276)	HMAC-SHA2-512 MAC Generation KAT	KAT	CAST	NCL STATUS OK	MAC Generation	Performed when the module is powered on
SHA2-256 (A4659)	SHA2-256 Message Digest KAT	KAT	CAST	NCL STATUS OK	Message Digest	Performed when the module is powered on
SHA2-256 (A5276)	SHA2-256 Message Digest KAT	KAT	CAST	NCL STATUS OK	Message Digest	Performed when the module is powered on

ESV - Adaptive Proportional Test (Continuous)	Cutoff value = 748	APT	CAST	NCL STATUS OK	Entropy Health Test	Performed before seeding the DRBG

Table 18: Conditional Self-Tests

The module does not implement a Software/Firmware Load Test, Manual Entry Test, Conditional Bypass Test nor Conditional Critical Functions Test.

10.3 Periodic Self-Test Information

During runtime, operators can initiate the conditional self-tests on demand by calling NCL_MISC_SelfTest and passing the algorithm as an argument.

The module's entropy source is powered on only momentarily to seed the module's SP800-90B DRBG. The module performs entropy source health tests defined in Section 4 of SP800-90B on the generated output prior to seeding the SP800-90B DRBG. After completing its execution, the entropy source powers down.

N/A for this module.

HSS SigVer	KAT	CAST	On demand	By calling NCL_MISC_SelfTest and passing the algorithm as an argument
ESV - Repetition Count Test (Startup)	RCT	CAST	On demand	Powering the chip off and on
ESV - Repetition Count Test (Continuous)	RCT	CAST	On demand	Powering the chip off and on

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
ESV - Adaptive Proportional Test (Startup)	APT	CAST	On demand	Powering the chip off and on
ESV - Adaptive Proportional Test (Continuous)	APT	CAST	On demand	Powering the chip off and on

Table 19: Conditional Periodic Information

10.4 Error States

For any of the conditional self-tests, the module enters an error state upon failing the self-test. A failure in the conditional CAST or conditional PCT results in “NCL_STATUS_FAIL”. Likewise, a failure of the entropy source health tests will result in an “ENTROPY_SRC_ERROR” status returned to the user. When in the error state, no cryptographic services are provided, control and data output is prohibited. The only method to clear this error state is to power cycle the device and then successfully pass the conditional self-tests.

Name	Description	Conditions	Recovery Method	Indicator
Error State	When in this error state, no cryptographic services are provided, control and data output is prohibited.	Failure in conditional self-test (conditional CAST or conditional PCT) Failure of the ENT health test	The only method to clear this error state is to power cycle the device and then successfully pass the conditional self-tests.	Failure in conditional self-test: NCL_STATUS_FAIL; Failure of the ENT health test: ENTROPY_SRC_ERROR

Table 20: Error States

11 Life-Cycle Assurance

11.1 Installation, Initialization, and Startup Procedures

The module is delivered as part of the Nuvoton NPCX499HA0BX (EC), Nuvoton NPCD324HA0DX (SIO) and Nuvoton NPCX499HA1BX (EC) platforms (listed in Table 2). During manufacturing – each chip is tested to ensure the module was manufactured correctly.

During execution – As part of the device boot process, the code is verified by a dedicated hardware inside the chip that checks every byte of code compared to a known parity bit. If any byte fails, the parity test then an internal error is generated; the error is handled by the application (User) firmware.

11.2 Administrator Guidance

The module is configured to be operational by default. If the device starts up successfully and has successfully passed the SHA2-256, HMAC- SHA2-512 and KBKDF-HMAC-SHA2-256 CASTs, it is operating correctly and can begin servicing User requests.

11.3 Non-Administrator Guidance

The module does not establish any SSPs for itself. Instead, the module provides this functionality as a service for other components within the TOEPP. The entity using the IUT must obtain required assurances listed in section 6.4 of SP 800-56BRev2 by performing the following steps:

1. The entity requesting the RSA key unwrapping (un-encapsulation) service from the module, shall only use an RSA private key that was generated by an active FIPS validated module that implements FIPS 186-5 compliant RSA key generation service and performs the key pair validity and the pairwise consistency as stated in section 6.4.1.1 of the SP 800-56BRev2. Additionally, the entity shall renew these assurances over time by using any method described in section 6.4.1.5 of the SP 800-56BRev2.
2. For use of an RSA key wrapping (encapsulation) service in the context of key transport per IG D.G, the entity using the module, shall verify the validity of the peer's public key using any method specified in section 6.4.2.1 of the SP 800-56BRev2.
3. The entity using the module, shall confirm the peer's possession of private key by using any method specified in section 6.4.2.3 of the SP 800-56BRev2.

To comply with the assurances found in Section 5.6.2 of SP 800-56Ar3, the operator must use module’s approved key pair generation service to generate ephemeral EC Diffie-Hellman key pair, or the key pair must be obtained from another FIPS-validated module. As part of this service, the module will internally perform the full public key validation of the generated public key. The module’s shared secret computation service will internally perform the full public key validation of the peer public key, complying with Sections 5.6.2.2.1 and 5.6.2.2.2 of SP 800-56Ar3.

11.4 End of Life

Once the module reaches its end-of-life stage (End of Life (EOL) date for the Nuvoton device is 10 years from manufacturing date) or sanitation is initiated by the module’s Operator, it is the Operator’s responsibility to clear all existing SSPs from the module. This can be achieved by either performing a full device reset, or by explicitly invoking the following sequence of APIs to clear the data from all modules:

- NCL_SHA_Clear - For each of existing SHA, HMAC, KBKDF contexts
- NCL_DRBG_Clear - For each of existing DRBG contexts
- NCL_AES_Clear - For each of existing AES contexts
- NCL_RSA_Clear - For each of existing RSA contexts
- NCL_ECC_Clear - For each of existing ECDSA and ECDH contexts
- NCL_HSS_Clear - For each of existing HSS contexts

12 Mitigation of Other Attacks

The module does not implement security mechanisms to mitigate other attacks.

Glossary and Abbreviations

AES	Advanced Encryption Standard
ACVP	Algorithm Certification Validation Program
CBC	Cipher Block Chaining
CAST	Cryptographic Algorithm Self-Test
CCM	Counter with Cipher Block Chaining-Message Authentication Code
CFB	Cipher Feedback
CMAC	Cipher-based Message Authentication Code
CMVP	Cryptographic Module Validation Program
CSP	Critical Security Parameter
CTR	Counter Mode
DRBG	Deterministic Random Bit Generator
ECB	Electronic Code Book
ECC	Elliptic Curve Cryptography
EOL	End Of Life
FIPS	Federal Information Processing Standards Publication
GCM	Galois Counter Mode
HMAC	Hash Message Authentication Code
HSS	Hierarchical Signature System
KAS	Key Agreement Scheme
KAT	Known Answer Test
LMS	Leighton-Micali Signature
MAC	Message Authentication Code
NIST	National Institute of Science and Technology
OFB	Output Feedback
PSS	Probabilistic Signature Scheme
RSA	Rivest, Shamir, Addleman
SHA	Secure Hash Algorithm
SHS	Secure Hash Standard
SSC	Shared Secret Computation
TOEPP	Tested Operational Environment’s Physical Perimeter
