1 General

1.1 Overview

This is a non-proprietary Cryptographic Module Security Policy for the Juniper Networks EX, QFX and ACX series network devices running Junos OS 22.3R2-S1.

1.2 Security Levels

The cryptographic module is designed to meet FIPS 140-3 Level 1 overall. The table below shows the security levels claimed for each section of the security requirements.

Section	Title	Security Level
1	General	1
2	Cryptographic module specification	1
3	Cryptographic module interfaces	1
4	Roles, services, and authentication	2
5	Software/Firmware security	1
6	Operational environment	1
7	Physical security	1
8	Non-invasive security	N/A
9	Sensitive security parameter management	1
10	Self-tests	1
11	Life-cycle assurance	1
12	Mitigation of other attacks	N/A
	Overall Level	1

Table 1: Security Levels

2 Cryptographic Module Specification

2.1 Description

Purpose and Use:

The following models are included in this validation and provide network switching and routing functionality:

- EX4650-48Y
- QFX5120-48T
- QFX5120-48Y
- QFX5200-32C
- MX204
- ACX5448

The cryptographic module runs Junos OS, Juniper's reliable, high-performance, modular network operating system that is supported across all of Juniper's physical and virtual routing, switching, and security platforms.

The cryptographic module provides for an encrypted connection, using SSH, between the management station and the module. All other data input or output from the modules are considered plaintext for this FIPS 140-3 validation.

Module Type:
The cryptographic module is a Hardware cryptographic module.

Module Embodiment:
The cryptographic module is defined as a MultiChipStand module that executes Junos OS 22.3R2-S1 firmware on any of the identified Juniper Networks devices.

Module Characteristics:
There are no additional characteristics relevant to this module.

Cryptographic Boundary:

The cryptographic boundary encompasses the entire Tested Operational Environment Physical Perimeter (TOEPP), which is defined as the outer edge of the chassis. The chassis is a rigid sheet-metal structure that houses all components of the device.

The cryptographic module is FIPS-compliant when installed and configured with Junos OS 22.3R2-S1 validated firmware as specified in section 11.1.

The physical form of the module is depicted in Figure 1 to Figure 12

2.2 Tested and Vendor Affirmed Module Version and Identification

Tested Module Identification – Hardware:

The following models of the module were tested.

Model and/or Part Number	Hardware Version	Firmware Version	Processors	Features
EX4650-48Y	EX4650-48Y	JUNOS 22.3R2-S1.7	Intel Xeon D-1518	48 x 1/10/25GbE SFP/SFP+; 8 x 40/100GbE QSFP+/QSFP28
QFX5120-48T	QFX5120-48T	JUNOS 22.3R2-S1.7	Intel Xeon D-1518	48 x1 /10GbE; 6 x 40/100GbE QSFP+/QSFP+
QFX5120-48Y	QFX5120-48Y	JUNOS 22.3R2-S1.7	Intel Xeon D-1518	48 x 1/10/25GbE SFP/SFP+; 8 x 40/100GbE QSFP+/QSFP28
QFX5120-32C	QFX5120-32C	JUNOS 22.3R2-S1.7	ntel Xeon E3-1105CV2	32 x 40/100GbE QSFP+/QSFP28; 2 x 10GbE SFP+
MX204	MX204	JUNOS 22.3R2-S1.7	Intel Xeon E5-2608	8 x 1/10GbE SFP+; 4 x 40/100GbE QSFP+/QSFP28
ACX5448	ACX5548	JUNOS 22.3R2-S1.7	Intel Xeon D-1528	44 1/10GbE SFP+/SFP ports; 6 x 10/100GbE QSFP28

Table 2: Tested Module Identification – Hardware

Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets): N/A

The module is not classified as software, firmware, or hybrid; thus, this section is not applicable.

Tested Module Identification – Hybrid Disjoint Hardware: N/A

The module is not classified as hybrid disjoint hardware; thus, this section is not applicable.

Tested Operational Environments - Software, Firmware, Hybrid: N/A

The module is not classified as software, firmware, or hybrid; thus, this section is not applicable.

Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid: N/A

There are no vendor-affirmed operational environments claimed.

2.3 Excluded Components

No components are excluded from the requirements of FIPS PUB 140-3.

2.4 Modes of Operation

The module supports an Approved mode only. The module enters Approved mode as a result of successful installation, initialization and configuration steps described in section 11. Until these procedures have been followed, the module is non-compliant.

Mode Name	Description	Type	Status Indicator
Approved	Approved mode of operation.	Approved	Suffix string ":fips" in the cli prompt

Table 3: Modes List and Description

2.5 Algorithms

Approved Algorithms:

Although the module may have been tested for additional algorithms or modes, only those listed below are utilized by the module.

OpenSSL 1.0.2

Algorithm	CAVP Cert	Properties	Reference
AES-CBC	A4210	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-CTR	A4210	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
ECDSA KeyGen (FIPS186-4)	A4210	Curve - P-256, P-384, P-521 Secret Generation Mode - Testing Candidates	FIPS 186-4
ECDSA KeyGen (FIPS186-4)	A4419	Curve - P-256, P-384, P-521 Secret Generation Mode - Testing Candidates	FIPS 186-4
ECDSA KeyGen (FIPS186-4)	A6440	Curve - P-256, P-384, P-521 Secret Generation Mode - Testing Candidates	FIPS 186-4
ECDSA KeyVer (FIPS186-4)	A4210	Curve - P-256, P-384, P-521	FIPS 186-4
ECDSA KeyVer (FIPS186-4)	A4419	Curve - P-256, P-384, P-521	FIPS 186-4
ECDSA KeyVer (FIPS186-4)	A6440	Curve - P-256, P-384, P-521	FIPS 186-4
ECDSA SigGen (FIPS186-4)	A4210	Curve - P-256, P-384, P-521 Hash Algorithm - SHA2-256, SHA2-384, SHA2-512	FIPS 186-4

Algorithm	CAVP Cert	Properties	Reference
ECDSA SigGen (FIPS186-4)	A4419	Curve - P-256, P-384, P-521 Hash Algorithm - SHA2-256, SHA2-384, SHA2-512	FIPS 186-4
ECDSA SigGen (FIPS186-4)	A6440	Component - No Curve - P-256, P-384, P-521 Hash Algorithm - SHA2-256, SHA2-384, SHA2-512	FIPS 186-4
ECDSA SigVer (FIPS186-4)	A4210	Curve - P-256, P-384, P-521 Hash Algorithm - SHA2-256, SHA2-384, SHA2-512	FIPS 186-4
ECDSA SigVer (FIPS186-4)	A4419	Curve - P-256, P-384, P-521 Hash Algorithm - SHA2-256, SHA2-384, SHA2-512	FIPS 186-4
ECDSA SigVer (FIPS186-4)	A6440	Component - No Curve - P-256, P-384, P-521 Hash Algorithm - SHA2-256, SHA2-384, SHA2-512	FIPS 186-4
HMAC-SHA-1	A4210	Key Length - Key Length: 160	FIPS 198-1
HMAC-SHA2-256	A4210	Key Length - Key Length: 256	FIPS 198-1

2.6 Security Function Implementations

The module implements the security functions listed in the following table.

Name	Type	Description	Properties	Algorithms
Enc/Dec (SSH)	BC-UnAuth	Unauthenticated encryption for SSH		AES-CBC: (A4210) AES-CTR: (A4210)
KAS-SSC (SSH)	KAS-SSC	Key Agreement Scheme Shared Secret Computation for SSH		KAS-ECC-SSC Sp800-56Ar3: (A4387)
KeyGen (SSH)	AsymKeyPair-KeyGen	Key Generation used for SSH authentication keys		ECDSA KeyGen (FIPS186-4): (A4210, A6440, A4419) ECDSA KeyVer (FIPS186-4): (A4210, A6440, A4419) RSA KeyGen (FIPS186-4): (A4210) HMAC DRBG: (A4417) CKG: ()
SigGen (SSH)	DigSig-SigGen	Signature Generation for peer authentication in SSH		ECDSA SigGen (FIPS186-4): (A4210, A6440, A4419) RSA SigGen (FIPS186-4): (A4210) SHA2-256: (A4210) SHA2-384: (A4210) SHA2-512: (A4210)
SigVer (SSH)	DigSig-SigVer	Signature Verification for peer authentication in SSH		ECDSA SigVer (FIPS186-4): (A4210, A6440, A4419) RSA SigVer (FIPS186-4): (A4210) SHA2-256: (A4210) SHA2-384: (A4210) SHA2-512: (A4210)
MAC (SSH)	MAC	Message authentication for SSH		HMAC-SHA-1: (A4210) HMAC-SHA2-256: (A4210) HMAC-SHA2-512: (A4210) SHA-1: (A4210) SHA2-256: (A4210) SHA2-512: (A4210)
KAS KeyGen (SSH)	KAS-KeyGen	Key Generation for Key Agreement in SSH		ECDSA KeyGen (FIPS186-4): (A4210, A6440,

Name	Type	Description	Properties	Algorithms
				A4419) ECDSA KeyVer (FIPS186-4): (A4210, A6440, A4419) CKG: () HMAC DRBG: (A4417)
KDF (SSH)	KAS-135KDF	Key derivation function for SSH		KDF SSH: (A4347) SHA-1: (A4210) SHA2-256: (A4210) SHA2-384: (A4210) SHA2-512: (A4210)
Full KAS (SSH)	KAS-Full	Full Key Agreement for SSH		ECDSA KeyGen (FIPS186-4): (A4210, A6440, A4419) ECDSA KeyVer (FIPS186-4): (A4210, A6440, A4419) KAS-ECC-SSC Sp800-56Ar3: (A4387) SHA-1: (A4210) SHA2-256: (A4210) SHA2-384: (A4210) SHA2-512: (A4210) KDF SSH: (A4347)
KTS (SSH)	KTS-Wrap	Key transport using SSH as per IG D.G provisions	KTS:128, 256, 384, 521, 2048, 3072, 4096 bit keys provide between 112 and 256 bits of encryption strength	AES-CBC: (A4210) AES-CTR: (A4210) HMAC-SHA-1: (A4210) HMAC-SHA2-256: (A4210) HMAC-SHA2-512: (A4210)
SHA (LibMD)	SHA	Message Digest Generation		SHA-1: (A4208) SHA2-256: (A4208) SHA2-512: (A4208)
MAC (LibMD)	MAC	Message Authentication		HMAC-SHA-1: (A4208) HMAC-SHA2-256: (A4208) SHA-1: (A4208) SHA2-256: (A4208)
DRBG (Kernel)	DRBG	Random Bit Generation		HMAC DRBG: (A4417) HMAC-SHA2-256: (A4417) SHA2-256: (A4417)
SHA (Kernel)	SHA	Entropy source conditioning component		SHA2-512: (A3329, A3498, A3330)
Verify image	DigSig-SigVer	Verification of firmware image		ECDSA SigVer (FIPS186-4):

Name	Type	Description	Properties	Algorithms
				(A4211, A6401) SHA2-256: (A4211)
Entropy Source	ENT-ESV	Entropy source		SHA2-512: (A3329, A3498, A3330)

Table 9: Security Function Implementations

2.7 Algorithm Specific Information

The module includes ECDSA algorithms that have been validated using FIPS 186-4 CAVP tests, which are mathematically identical to FIPS 186-5 CAVP tests. Per IG C.K, all RSA and ECDSA algorithms implemented by the module are claimed compliant with FIPS 186-5.
The module complies with IG C.F. RSA Key Generation, Signature Generation and Signature Verification have been tested and validated using CAVP testing for all implemented modulus lengths (2048, 3072 and 4096 bits). The number of Miller-Rabin tests used for primality testing as part of RSA Key Generation is consistent with Table C.3.

The module implements the following Approved key agreement methods which have been CAVP tested and validated:

- KAS-ECC per SP 800-56A Rev. 3 (FIPS 140-3 IG D.F Scenario 2, path 2).

The module obtains the FIPS 140-3 IG D.F required key agreement assurances in accordance with Section 5.6.2 of SP800-56A Rev. 3. All the key agreement protocols implemented by the module are Diffie-Hellman based.

2.8 RBG and Entropy

The tables below indicate the entropy source used by the module and their associated certificates.

Cert Number	Vendor Name
E89	Juniper Networks

Table 10: Entropy Certificates

Name	Type	Operational Environment	Sample Size	Entropy per Sample	Conditioning Component
QFX5200-48Y - Junos OS 22.3 Entropy Source (E89)	Non-Physical	Intel Xeon D-1518	512 bits	448 bits	A3498 (SHA2-512)
ACX5448 - Junos OS 22.3 Entropy Source (E89)	Non-Physical	Intel Xeon D-1528	512 bits	448 bits	A3330 (SHA2-512)
MX204 - Junos OS 22.3 Entropy Source (E89)	Non-Physical	Intel Xeon E5-2608L	512 bits	448 bits	A3329 (SHA2-512)
QFX5200-32C - Junos OS 22.3 Entropy Source (E89)	Non-Physical	Intel Xeon E3-1105CV2	512 bits	448 bits	A3498 (SHA2-512)

Table 11: Entropy Sources

The entropy source is used to seed the module's HMAC DRBG with the minimum required 256-bits of entropy. Each 512-bit block of conditioned output from the entropy source contains 448 bits of entropy. The HMAC DRBG is used for all random data required by the module, including key generation.

There are no initialization procedures required by the users of the module to operate the entropy source in a compliant manner. The module complies with the ESV Public Use document of the validated entropy source (Cert. E89).

2.9 Key Generation

The cryptographic module implements the key generation methods listed above in the Security Functions implementation table.

2.10 Key Establishment

The cryptographic module implements the key establishment methods listed above in the Security Functions implementation table.

2.11 Industry Protocols

The cryptographic module supports the protocols listed below. No part of these protocols, other than the approved cryptographic algorithms and the KDFs, have been tested by the CAVP and CMVP. The SSH algorithms allow independent selection of key exchange, authentication, cipher, and integrity. In reference to the supported protocols table below, each column of options for a given protocol is independent and may be used in any viable combination.

Protocol	Key Exchange	Auth	Cipher	Integrity
SSHv2	EC Diffie-Hellman P-256 EC Diffie-Hellman P-384 EC Diffie-Hellman P-521	ECDSA P-256 ECDSA P-384 ECDSA P-521 RSA 2048 RSA 3072 RSA 4096	AES CBC 128/192/256 AES CTR 128/192/256	HMAC-SHA-1 HMAC-SHA2-256 HMAC-SHA2-512

3 Cryptographic Module Interfaces

3.1 Ports and Interfaces

The following table maps each physical interface to one or more logical interface types defined in the FIPS 140-3 standard. The module does not have a Control Output Interface.

Physical Port	Logical Interface(s)	Data That Passes
Ethernet (data)	Data Input Data Output	LAN communications

Physical Port	Logical Interface(s)	Data That Passes
	Control Input Status Output	
Ethernet (mgmt.)	Data Input Data Output Control Input Status Output	Remote management
Serial	Data Input Data Output Control Input Status Output	Console serial port management
Power	Power	Power
Reset button	Control Input	Reset
USB	Data Input Control Input	Firmware load port
LED	Status Output	Status indicator lighting
Timing interface ports: PPS and 10M GPS (ACX5448 and QFX5120 models only)	Control Input	Clock and timing signals from external devices

Table 12: Ports and Interfaces

4 Roles, Services, and Authentication

4.1 Authentication Methods

The module implements two forms of role-based authentication methods, as described in the following table.

Method Name	Description	Security Mechanism	Strength Each Attempt	Strength per Minute
Password authentication	User and CO authentication via SSH or consol. Minimum of 10 ASCII character passwords.	SHA (LibMD)	Probability of guessing: 1/(96^10) < 1/1,000,000.	Timed access mechanism allows max of 10 attempts / min. Probability of guessing: 10/(96^10) < 1/100,000.
Signature authentication	User/CO authentication via SSH	SigVer (SSH)	Strength of signature algorithm, minimum 112-bits. Probability of success for random attempt: 1/(2^112) < 1/1,000,000.	A rate of 1 CPU cycle per failed authentication for the Intel Xeon D-1518 processor (4 cores, 2.2 GHz) allows for the probability of success by brute-force attack: 60 x 4 x 2.2 x 10^9 x 1/(2^112) < 1/100,000.

Table 13: Authentication Methods

4.2 Roles

Name	Type	Operator Type	Authentication Methods
Crypto Officer	Role	CO	Password authentication Signature authentication
User	Role	Monitor	Password authentication Signature authentication

Table 14: Roles

The module supports two roles: Cryptographic Officer (CO) and User. The module supports role-based operator authentication for assuming these roles, using methods specified in Section 4.1. The module supports concurrent operators but does not support a maintenance role and/or bypass capability. The module enforces the separation of roles using either of the role-based operator authentication methods in Section 4.1.

The Cryptographic Officer role configures and monitors the module via a console or SSH connection. As root or super-user, the Cryptographic Officer has permission to view and edit secrets within the module.

The User role monitors the module via the console or SSH. The user role cannot change the configuration.

4.3 Approved Services

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Configure Security	Security relevant configuration	':fips' suffix in CLI prompt	CLI Command	Status	SHA (Kernel) Entropy Source KeyGen (SSH) SHA (LibMD) MAC (LibMD) DRBG (Kernel)	Crypto Officer - HMAC DRBG V value: E - HMAC DRBG Key value: E - HMAC DRBG Entropy Input: E - HMAC DRBG Seed: E - User-PW: W - CO-PW: W - Root-PW: W - SSH PUB: G,R,W - SSH PHK: G,R,W
Configure	Non-security relevant configuration	None	CLI Command	Status	None	Crypto Officer
Show status	Show status	None	None	':fips' suffix in CLI prompt	None	Crypto Officer User

Table 15: Approved Services

4.4 Non-Approved Services

The module does not offer any non-approved services.

N/A for this module.

4.5 External Software/Firmware Loaded

The module includes a firmware load service that is used to install the Junos OS firmware image as part of installation of the module, as described in Section 11.1. The loaded firmware is a complete image replacement and constitutes an entirely new module and version of Junos OS which would require a separate FIPS 140-3 validation.

5 Software/Firmware Security

5.1 Integrity Techniques

The cryptographic module implements a firmware integrity self-test that uses ECDSA P-256 with SHA2-256 to ensure the integrity of all Junos OS firmware components. The self-test is automatically run on power-up.

5.2 Initiate on Demand

The firmware integrity test can be run on demand by the module's operator by power cycling the module.

6 Operational Environment

6.1 Operational Environment Type and Requirements

Type of Operational Environment: Non-Modifiable

The module consists of hardware containing a non-modifiable operational environment as per the FIPS 140-3 definitions. It includes a firmware load service to support necessary updates. The loaded firmware is a complete image replacement and constitutes an entirely new module and version of Junos OS which would require a separate FIPS 140-3 validation.

6.2 Configuration Settings and Restrictions

There are no security rules, settings, or restrictions to the configuration of the operational environment beyond the initialization instructions to set the module in Approved mode.

7 Physical Security

7.1 Mechanisms and Actions Required

The module's physical embodiment meets Level 1 Physical Security requirements. The module is completely enclosed in a rectangular nickel or clear zinc coated, cold rolled steel, plated steel and brushed aluminum enclosure. There are no ventilation holes, gaps, slits, cracks, slots, or crevices that would allow for any sort of observation of any component contained within the cryptographic boundary.

Mechanism	Inspection Frequency	Inspection Guidance
Opaque metal enclosure	n/a	n/a

Table 16: Mechanisms and Actions Required

8 Non-Invasive Security

This section is not applicable, as there are currently no approved non-invasive mitigation techniques specified in ISO/IEC 19790:2012.

9 Sensitive Security Parameters Management

9.1 Storage Areas

The table below lists the areas within the module's cryptographic boundary where SSPs can be stored.

Storage Area Name	Description	Persistence Type
RAM	Random Access Memory	Dynamic
Flash	Internal flash memory storage drive	Static

Table 17: Storage Areas

9.2 SSP Input-Output Methods

The table below lists the method used by the module for the input and output of SSPs.

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
Manual CLI entry	Local CO	RAM	Plaintext	Manual	Direct	
Entry via SSH	Remote CO	RAM	Encrypted	Automated	Electronic	KTS (SSH)
Entry via console	Local CO	RAM	Plaintext	Manual	Electronic	
Output via SSH	RAM	Remote CO	Encrypted	Automated	Electronic	KTS (SSH)
Output via console	RAM	Local CO	Plaintext	Manual	Electronic	
Entry as part of KAS	Remote peer	RAM	Plaintext	Automated	Electronic	Full KAS (SSH)
Output as part of KAS	RAM	Remote peer	Plaintext	Automated	Electronic	Full KAS (SSH)

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
Pre-loaded	Manufacturer	Flash	Plaintext	Manual	Direct	

Table 18: SSP Input-Output Methods

9.3 SSP Zeroization Methods

The table below describes the SSP zeroization methods employed by the module.

Zeroization Method	Description	Rationale	Operator Initiation
Zeroize CLI command	This command erases all data, including all configuration information, returning the module to its factory default state The system is then rebooted.	This command erases all keys and CSPS from storage. The forced power cycle also zeroizes SSPs in volatile memory.	Yes, CO via invocation of zeroize CLI command.
Reset	Zeroization of SSPs in RAM via invocation of local or remote reset service.	RAM is volatile and all data is lost when power is taken off. Zeroization is practically instantaneous.	Yes, both User and CO, via invocation of Local Reset or Remote Reset services.
Explicit zeroize function	Zeroization of SSPs in memory when no longer needed.	Use of explicit zeroization function destroys SSP information immediately by overwriting memory area with zeroes.	No. The operator cannot directly initiate this method.

Table 19: SSP Zeroization Methods

The CO can run the following commands to zeroize the approved mode SSPs:

```
user@host> request system zeroize
```

This command wipes clean all the SSPs/configs as well as the disk and install a factory default firmware image. After zeroizing the system, the module is no longer in a FIPS compliant state. Installation and configuration as per section 11.1 is required to enter the FIPS compliant state and enable the Approved mode of operation.

The Cryptographic Officer must retain control of the module while zeroization is in process.

Zeroization commands, as described above, and power cycling are initiated by the operator. The module automatically zeroizes all SSPs when no longer required by calling explicit delete commands. Session termination is initiated by the operator or by environmental errors.
The completion of zeroization is indicated implicitly. If the zeroization is initiated using a zeroization command or explicit delete command, completion of the command indicates that zeroization has successfully completed. If the zeroization is initiated by power cycling the module, then successful reboot of the module indicates that zeroization has completed successfully. In the case of zeroization initiated by session termination, SSPs are zeroized when the session terminates, and session termination is indicated in the log.

9.4 SSPs

All SSPs used by the module are described in this section.

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
HMAC DRBG V value	A critical value of the internal state of DRBG	256 - 256	DRBG internal state - CSP	DRBG (Kernel)		DRBG (Kernel)
HMAC DRBG Key value	A critical value of the internal state of DRBG	256 - 256	DRB internal state - CSP	DRBG (Kernel)		DRBG (Kernel)
HMAC DRBG Entropy Input	A critical value of the internal state of DRBG provided by entropy source	256 - 256	Entropy source output - CSP	Entropy Source		DRBG (Kernel)
HMAC DRBG Seed	Seed material used to seed or reseed the HMAC DRBG	256 - 256	DRBG internal state - CSP	DRBG (Kernel)		DRBG (Kernel)
SSH DH Shared Secret	Shared DH value computed from the ephemeral DH key-pairs as part of SSH and used to derive session keys.	256, 384, 521 - 128, 192, 256	DH shared value - CSP		KAS-SSC (SSH)	KDF (SSH)
SSH PHK	SSH Private host key. 1st time SSH is configured, the keys are generated.	2048, 256, 4096, 384, 521 - 112, 128, 152, 192, 256	Asymmetric private key - CSP	KeyGen (SSH)		SigGen (SSH)
SSH PUB	SSH Public Host Key	2048, 256, 4096, 384, 521 - 112, 128, 152, 192, 256	Asymmetric public key - PSP	KeyGen (SSH)		SigVer (SSH)
SSH DH PRV	SSH KAS private key	256, 384, 521 - 128, 192, 256	Asymmetric private key - CSP	KAS KeyGen (SSH)		KAS-SSC (SSH) Full KAS (SSH)
SSH DH PUB	SSH KAS public key	256, 384, 521 - 128, 192, 256	Asymmetric public key - PSP	KAS KeyGen (SSH)		
SSH DH Pub (peer)	SSH KAS public key from peer	256, 384, 521 - 128, 192, 256	Asymmetric public key - PSP			KAS-SSC (SSH) Full KAS (SSH)
SSH-SEKs	SSH Session Encryption Keys	128, 192, 256 - 128, 192, 256	Symmetric key - CSP		KDF (SSH) Full KAS (SSH)	Enc/Dec (SSH) MAC (SSH)
CO-PW	Password used to authenticate the CO.	Min 10 characters - n/a	Authentication password - CSP		KTS (SSH)	SHA (LibMD)
Root-PW	Password used by CO to authenticate as 'root'.	Min 10 characters - n/a	Authentication password - CSP		KTS (SSH)	SHA (LibMD)
User-PW	Password used to authenticate User	Min 10 characters - n/a	Authentication password - CSP		KTS (SSH)	SHA (LibMD)

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
Auth-CO Pub	SSH CO Authentication Public Key	2048, 4096, 256, 384, 521 - 112, 128, 152, 192, 256	Asymmetric public key - PSP		KTS (SSH)	SigVer (SSH)
Auth-User Pub	SSH User Authentication Public Key	2048, 4096, 256, 384, 521 - 112, 128, 152, 192, 256	Asymmetric public key - PSP		KTS (SSH)	SigVer (SSH)
Root-CA	X.509 Certificate used to verify the validity of the Juniper Package CA	256, 384 - 128, 196	Asymmetric public key - PSP			Verify image
Package-CA	X.509 Certificate used to verify the validity the Juniper Image at software load and also at runtime for integrity.	256 - 128	Asymmetric public key - PSP			Verify image

Table 20: SSP Table 1

Table 21: SSP Table 2

9.5 Transitions

The following transitions apply to algorithms used by this module:

SHA-1: The SHA-1 hash algorithm will be non-Approved for all cryptographic purposes after December 31, 2030.

10 Self-Tests

On power up or reset, the module performs the pre-operational self-tests and the indicated conditional cryptographic algorithm self-tests described below. All KATs must be completed successfully prior to any other use of cryptography by the module. The CASTs for algorithms utilized in the pre-operational Firmware integrity check are performed prior to the Firmware integrity check.

10.1 Pre-Operational Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details
Firmware integrity check	ECDSA P-256 with SHA2-256	KAT	SW/FW Integrity	PASS/FAIL console output	ECDSA verify
Critical functions test	SHA2-256	KAT	Critical Function	PASS/FAIL console output	Checks that any file that is executed is registered in a manifest of executable files that comes with the firmware. Test verifies the integrity of the operational environment is being enforced by having the kernel attempt to run a specific executable file that does not contain a hash in the manifest file, verifying it cannot be executed.

Table 22: Pre-Operational Self-Tests

10.2 Conditional Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
Entropy Source (start-up)	n/a	APT, RCT	CAST	PASS/FAIL console output	Start-up	On-power up
Entropy Source (continuous)	n/a	APT, RCT	CAST	Console output / output of entropy source	Continuous	Data output from noise source
AES-CBC (A4210) Encrypt	Key size: 128, 192, 256	KAT	CAST	PASS/FAIL console output	Encrypt	On power-up
AES-CBC (A4210) Decrypt	Key size: 128, 192, 256	KAT	CAST	PASS/FAIL console output	Decrypt	On power-up
HMAC-SHA-1 (A4210)	Key size: 160	KAT	CAST	PASS/FAIL console output	MAC	On power-up
HMAC-SHA2-256 (A4210)	Key size: 256	KAT	CAST	PASS/FAIL console output	MAC	On power-up
HMAC-SHA2-384 (A4210)	Key size: 384	KAT	CAST	PASS/FAIL console output	MAC	On power-up
HMAC-SHA2-512 (A4210)	Key size: 512	KAT	CAST	PASS/FAIL console output	MAC	On power-up

SHA2-512 (A3329)	KAT	CAST	On demand	Manually
Manual SSP entry	Duplicate entry	Manual Entry	On condition trigger	Automatic

Table 25: Conditional Periodic Information

10.4 Error States

Name	Description	Conditions	Recovery Method	Indicator
Critical Failure State	The cryptographic module ceases to perform cryptographic operations, inhibits all data output, and provides status of the error via syslog messages and console status output	On any power-up self-test error	Power cycle	Console status indicator
Soft Error State	A non-critical self-test failure occurs, causing a failure of the triggering operation	PCT, firmware load test, continuous entropy health test failure	The module processes the error, and resumes normal operation	Console displays error

Table 26: Error States

The module enters error state upon failure of any self-tests, causing the kernel to 'panic' and all execution to halt. The only way to exit from this state is to reboot the module, which causes the self-tests to be repeated and pass successfully before the corresponding algorithms are usable.

10.5 Operator Initiation of Self-Tests

Self–tests that are performed at power-up are available on demand by power cycling the module.

11 Life-Cycle Assurance

11.1 Installation, Initialization, and Startup Procedures

Before installation of module firmware, CO must first zeroize any module SSPs by following the instructions in Section 9.3.

Once zeroization is complete, the CO must install the JUNOS firmware image on the device using the following CLI command:

```
CO@host> request system software add /<image-path>/<image-filename>
no-copy no-validate reboot.
```

The image-filenames for the validated firmware are as follows:

- EX series: jinstall-host-ex-4e-x86-64-22.3R2-S1.7-secure-signed.tgz
- QFX series: jinstall-host-qfx-5e-x86-64-22.3R2-S1.7-secure-signed.tgz
- MX series: junos-vmhost-install-mx-x86-64-22.3R2-S1.7.tgz
- ACX series: junos-vmhost-install-acx-x86-64-22.3R2-S1.7.tgz

Next, the CO shall proceed as follows:

1. Enable the approved mode on the device.

   ```
   CO@host> set system fips chassis level 1
   ```

2. Set the root password.

   ```
   user@host# set system root-authentication plain-text-password
   New password: <type password here>
   ```

3. Commit and reboot the device.

   ```
   CO@host# commit
   ```

Once the module is rebooted and the integrity and self-tests have run successfully on initial power-on in, the module is operating in the approved mode of operation. The CO must create a backup image of the firmware to ensure it is also an approved mode Junos OS image by issuing the `request system snapshot` command.

The `show version` command will display the version of the Junos OS on the device so that the CO can confirm it is the FIPS validated version. The CO should also verify the presence of the suffix string ":fips" in the cli prompt, indicating the module is operating in approved mode.
TLS and IKE/IPsec are not enabled by default and must not be enabled for FIPS compliant usage of the module.

11.2 Administrator Guidance

The Cryptographic Officer is the person responsible for enabling, configuring, monitoring, and maintaining the module in approved mode. The Cryptographic Officer securely installs Junos OS on the device, enables the approved mode of operation, establishes keys and passwords for other users and software modules, and initializes the device before network connection. The

Cryptographic Officer can configure and monitor the module through a console or SSH connection.

11.3 Non-Administrator Guidance

No specific non-administrator guidance is required to operate the module.

11.4 Design and Rules

11.4.1 Module Design Rules

The module design implements the following security rules:

1. The module clears previous authentications on power cycle.
2. Power up self-tests do not require any operator action.
3. Data output is inhibited during key generation, self-tests, zeroization, and error states.
4. Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the module.
5. There are no restrictions on which SSPs are zeroized by the zeroization service.
6. The module does not support a maintenance interface or role.
7. The module does not output intermediate key values.
8. The module requires two independent internal actions to be performed prior to outputting plaintext CSPs.

11.4.1 Module Operation Rules

The following are requirements for compliant usage of the module:

1. The cryptographic officer must retain control of the module while zeroization is in process.
2. The cryptographic officer shall verify that the firmware image to be loaded on the module is a FIPS validated image.
3. Before pushing the factory reset button on the device, the cryptographic officer shall perform the zeroize command as described in section 9.3
4. The password minimum-length must be configured to be at least 10.
5. The module shall not be configured to use a radius server and the radius server capability shall be disabled.
6. SSH key-exchange must not be configured to include ‘dh-group14-sha1’.

11.5 Maintenance Requirements

No special maintenance requirements are required.

11.6 End of Life

When disposing of the cryptographic module, the cryptographic officer shall perform the zeroize command as described in Section 9.3.

12 Mitigation of Other Attacks

The module does not implement mechanisms to mitigate other attacks beyond what is described in this security policy.
