-------------------------------	---

1 General

1.1 Overview

This document is the non-proprietary FIPS 140-3 Security Policy for version kernel 4.18.0-477.72.1.el8_8; libkcapi 1.2.0-3.el8_8 of the Red Hat Enterprise Linux 8 Kernel Cryptographic API module. It contains the security rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-3 (Federal Information Processing Standards Publication 140-3) for an overall Security Level 1 module.

This Non-Proprietary Security Policy may be reproduced and distributed, but only whole and intact and including this notice. Other documentation is proprietary to their authors.

1.1.1 How this Security Policy was prepared

In preparing the Security Policy document, the laboratory formatted the vendor-supplied documentation for consolidation without altering the technical statements therein contained. The further refining of the Security Policy document was conducted iteratively throughout the conformance testing, wherein the Security Policy was submitted to the vendor, who would then edit, modify, and add technical contents. The vendor would also supply additional documentation, which the laboratory formatted into the existing Security Policy, and resubmitted to the vendor for their final editing.

1.2 Security Levels

Section	Title	Security Level

8	Non-invasive security	N/A
9	Sensitive security parameter management	1
10	Self-tests	1
11	Life-cycle assurance	1
12	Mitigation of other attacks	N/A
	Overall Level	1

Table 1: Security Levels

2 Cryptographic Module Specification

2.1 Description

Purpose and Use:

The Red Hat Enterprise Linux 8 Kernel Cryptographic API (hereafter referred to as “the module”) provides a C language application program interface (API) for use by other (kernel space and user space) processes that require cryptographic functionality. The module operates on a general-purpose computer as part of the Linux kernel. Its cryptographic functionality can be accessed using the Linux Kernel Crypto API.

Module Type: Software

Module Embodiment: MultiChipStand

Cryptographic Boundary:

The cryptographic boundary of the module is defined as the kernel binary and the kernel crypto object files, the libkcapi library, and the sha512hmac binary, which is used to verify the integrity of the software components. In addition, the cryptographic boundary contains the .hmac files which store the expected integrity values for each of the software components.

Tested Operational Environment’s Physical Perimeter (TOEPP):

The TOEPP of the module is defined as the general-purpose computer on which the module is installed.

The PAA/PAI provided by the processor is located within the module’s physical perimeter and outside of the module’s cryptographic boundary.

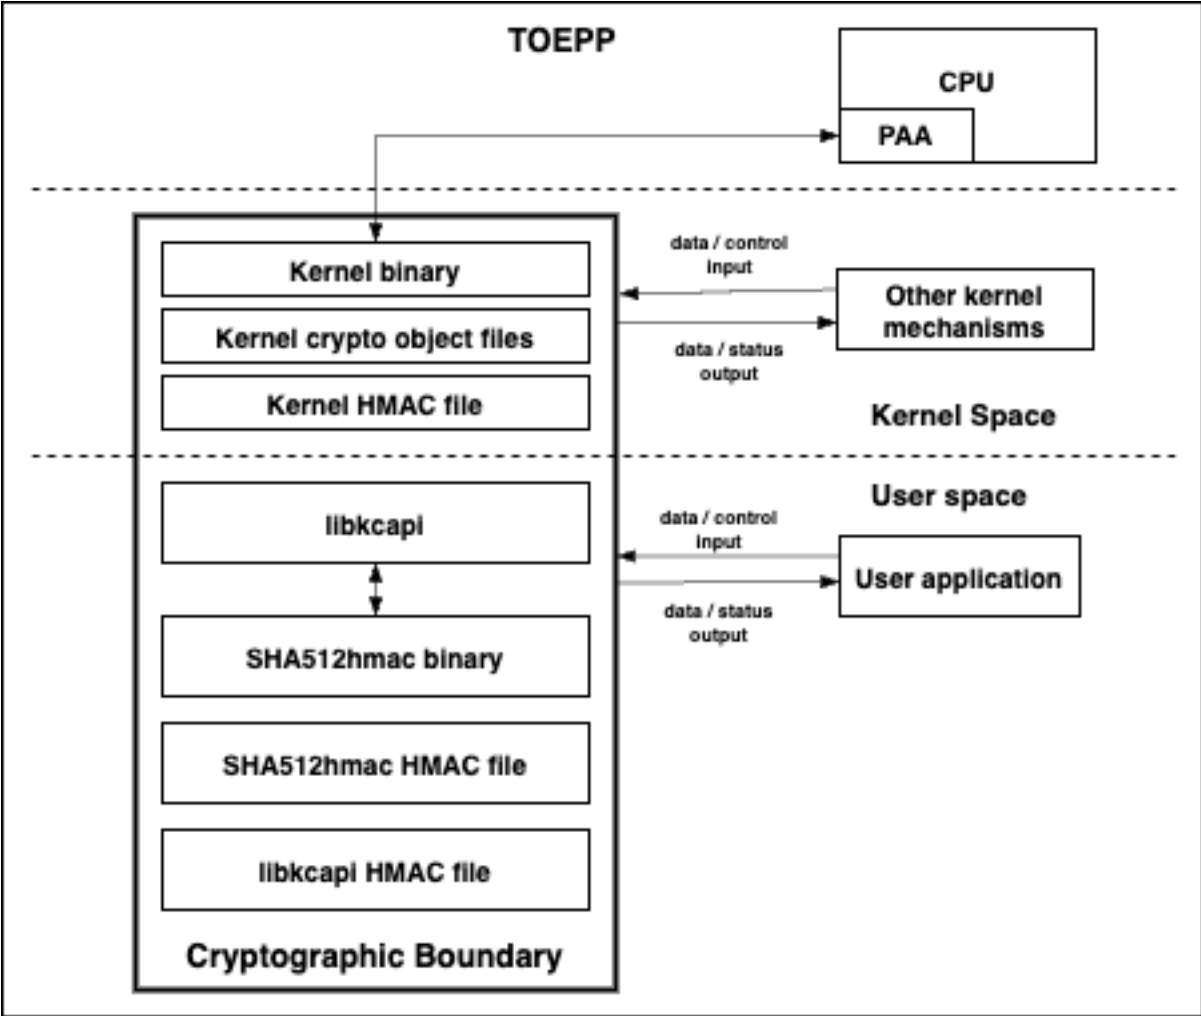

Figure 1: Block Diagram

2.2 Tested and Vendor Affirmed Module Version and Identification

Tested Module Identification - Hardware:

N/A for this module.

Tested Module Identification - Software, Firmware, Hybrid (Executable Code Sets):

Package or File Name	Software/ Firmware Version	Features	Integrity Test
/boot/vmlinuz-4.18.0-477.72.1.el8_8.x86_64; *.ko and *.ko.xz files in /usr/lib/modules/4.18.0- 477.72.1.el8_8.x86_64/kernel/crypto *.ko and *.ko.xz files in /usr/lib/modules/4.18.0-	4.18.0- 477.72.1.el8_8; 1.2.0-3.el8_8	N/A	HMAC- SHA2-512; RSA signature verification

Package or File Name	Software/ Firmware Version	Features	Integrity Test
477.72.1.el8_8.x86_64/kernel/arch/x86/crypto; /usr/lib64/libkcapi.so.1.2.0, /usr/bin/sha512hmac			

Table 2: Tested Module Identification - Software, Firmware, Hybrid (Executable Code Sets)

Tested Module Identification - Hybrid Disjoint Hardware:

N/A for this module.

Tested Operational Environments - Software, Firmware, Hybrid:

Operating System	Hardware Platform	Processors	PAA/PAI	Hypervisor or Host OS	Version(s)
Red Hat Enterprise Linux 8	Dell PowerEdge R440	Intel Xeon Silver 4216	Yes	N/A	4.18.0-477.72.1.el8_8; 1.2.0-3.el8_8
Red Hat Enterprise Linux 8	Dell PowerEdge R440	Intel Xeon Silver 4216	No	N/A	4.18.0-477.72.1.el8_8; 1.2.0-3.el8_8

Table 3: Tested Operational Environments - Software, Firmware, Hybrid

Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid:

Operating System	Hardware Platform
Red Hat Enterprise Linux 8	Intel Xeon E5

Table 4: Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid

CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.

2.3 Excluded Components

There are no components within the cryptographic boundary excluded from the FIPS 140-3 requirements.

2.4 Modes of Operation

Modes List and Description:

Mode Name	Description	Type	Status Indicator
Approved mode	Automatically entered whenever an approved	Approved	For all approved algorithms except GCM: respective approved service function returns indicator 0; For GCM:

Mode Name	Description	Type	Status Indicator
	service is requested		crypto_aead_get_flags(tfm) has the CRYPTO_TFM_FIPS_COMPLIANCE flag set
Non-approved mode	Automatically entered whenever a non-approved service is requested	Non-Approved	No service indicator required for non-approved services per IG 2.4.C

Table 5: Modes List and Description

After the module is powered on, it performs all the pre-operational self-tests and cryptographic algorithm self-tests without operator intervention. Only after all the self-tests are successful, the module automatically transitions to the approved mode.

Mode Change Instructions and Status:

The module automatically switches between the approved and non-approved modes depending on the services requested by the operator. The status indicator of the mode of operation is equivalent to the indicator of the service that was requested.

Degraded Mode Description:

The module does not implement a degraded mode of operation.

2.5 Algorithms

Approved Algorithms:

Algorithm	CAVP Cert	Properties	Reference

Random number generation with DRBGs	DRBG	Generate random numbers from DRBGs	Counter DRBG:128, 192, 256 bits HMAC DRBG:128, 256 bits Hash DRBG:128, 256 bits	Counter DRBG: (A5720, A5724, A5725, A5726, A5727, A5728, A5729, A5730, A5731) Hash DRBG: (A5720, A5724, A5725, A5726, A5727, A5728, A5729, A5730, A5731, A5734, A5735, A5736) HMAC DRBG: (A5720, A5724, A5725, A5726, A5727, A5728,

Name	Type	Description	Properties	Algorithms
				A5729, A5730, A5731, A5734, A5735, A5736)
Signature verification with RSA	DigSig-SigVer	Verify a signature with RSA	Padding:PKCS#1 v1.5 Hashes:SHA-256 Key size(s):3072 bits (128 bits)	RSA SigVer (FIPS186-5): (A5720, A5734, A5735, A5736)
Authenticated encryption with AES	BC-Auth	Encrypt and authenticate a plaintext with AES	Key size(s):128, 192, 256 bits	AES-CCM: (A5720, A5729) AES-GCM: (A5724, A5727, A5730) AES-CBC: (A5720, A5726, A5729) AES-CTR: (A5720, A5726, A5729) HMAC-SHA-1: (A5720, A5734, A5735, A5736) HMAC-SHA2-256: (A5720, A5734, A5735, A5736) HMAC-SHA2-384: (A5720, A5734, A5735, A5736) HMAC-SHA2-512: (A5720, A5734, A5735, A5736)
Authenticated decryption with AES	BC-Auth	Decrypt and authenticate a ciphertext with AES	Key size(s):128, 192, 256 bits	AES-CCM: (A5720, A5729) AES-GCM: (A5720, A5725, A5726, A5728, A5729, A5731) AES-CBC: (A5720, A5726, A5729) AES-CTR: (A5720, A5726, A5729) HMAC-SHA-1: (A5720, A5734, A5735, A5736) HMAC-SHA2-256: (A5720, A5734, A5735,

Name	Type	Description	Properties	Algorithms
				A5736) HMAC-SHA2-384: (A5720, A5734, A5735, A5736) HMAC-SHA2-512: (A5720, A5734, A5735, A5736)

Table 8: Security Function Implementations

2.7 Algorithm Specific Information

2.7.1 AES GCM IV

The Crypto Officer shall consider the following requirements and restrictions when using the module.

For IPsec, the module offers the AES GCM implementation and uses the context of Scenario 1 of FIPS 140-3 IG C.H. The mechanism for IV generation is compliant with RFC 4106. IVs generated using this mechanism may only be used in the context of AES GCM encryption within the IPsec protocol.

The module does not implement IPsec. The module's implementation of AES GCM is used together with an application that runs outside the module's cryptographic boundary. This application must use RFC 7296 compliant IKEv2 to establish the shared secret SKEYSEED from which the AES GCM encryption keys are derived.

The design of the IPsec protocol implicitly ensures that the counter (the nonce_explicit part of the IV) does not exhaust the maximum number of possible values for a given session key. In the event the module's power is lost and restored, the consuming application must ensure that a new key for use with the AES GCM key encryption or decryption under this scenario shall be established.

The module also provides a non-approved AES GCM encryption service which accepts arbitrary external IVs from the operator. This service can be requested by invoking the crypto_aead_encrypt API function with an AES GCM handle. When this is the case, the API will not set an approved service indicator, as described in Section 4.3.

2.7.2 AES XTS

The length of a single data unit encrypted or decrypted with AES XTS shall not exceed 2^{20} AES blocks, that is 16MB, of data per XTS instance. An XTS instance is defined in Section 4 of SP 800-38E. To meet the requirement stated in IG C.I, the module implements a check to ensure that the two AES keys used in AES XTS mode are not identical.

The XTS mode shall only be used for the cryptographic protection of data on storage devices. It shall not be used for other purposes, such as the encryption of data in transit.

2.7.3 RSA

For RSA signature verification, the module supports modulus size 3072 bits. The supported modulus size has been CAVP tested.

2.7.4 SHA-3

The module provides SHA-3 hash functions compliant with IG C.C. Every implementation of each SHA-3 function was tested and validated on all the module's operating environments. SHAKE functions are not implemented. SHA-3 hash functions are also used as part of a higher-level algorithm for HMAC.

2.8 RBG and Entropy

Cert Number	Vendor Name
E174	Red Hat, Inc.

Table 9: Entropy Certificates

Name	Type	Operational Environment	Sample Size	Entropy per Sample	Conditioning Component
RHEL 8 Kernel CPU Time Jitter RNG Entropy Source	Non-Physical	Red Hat Enterprise Linux 8 on Dell PowerEdge R440	64 bits	57.30 bits	Linear-Feedback Shift Register (LFSR)

Table 10: Entropy Sources

The module implements three different Deterministic Random Bit Generator (DRBG) implementations based on SP 800-90Ar1: CTR_DRBG, Hash_DRBG, and HMAC_DRBG. Each of these DRBG implementations can be instantiated by the operator of the module. When instantiated, these DRBGs can be used to generate random numbers for external usage.

Additionally, the module employs a specific HMAC-SHA2-512 DRBG implementation for internal purposes (e.g. to generate initialization vectors). This DRBG is initially seeded with 384 output bits from the entropy source (343 bits of entropy) and reseeded with 256 output bits from the entropy source (229 bits of entropy).

2.9 Key Generation

The module does not provide key generation.

2.10 Key Establishment

The module does not provide key establishment.

2.11 Industry Protocols

AES GCM with internal IV generation in the approved mode is compliant with RFC 4106 and shall only be used in conjunction with the IPsec protocol. No parts of this protocol, other than the AES GCM implementation, have been tested by the CAVP and CMVP.

3 Cryptographic Module Interfaces

3.1 Ports and Interfaces

Physical Port	Logical Interface(s)	Data That Passes
N/A	Data Input	API data input parameters, AF_ALG type sockets
N/A	Data Output	API data output parameters, AF_ALG type sockets
N/A	Control Input	API function calls, API control input parameters, AF_ALG type sockets, kernel command line
N/A	Status Output	API return values, AF_ALG type sockets, kernel logs

Table 11: Ports and Interfaces

The logical interfaces are the APIs through which the applications request services. These logical interfaces are logically separated from each other by the API design, AF_ALG type socket that allows the applications running in the user space to request cryptographic services from the module.

The module does not support a control output interface.

4 Roles, Services, and Authentication

4.1 Authentication Methods

N/A for this module.

The module does not implement authentication.

4.2 Roles

Name	Type	Operator Type	Authentication Methods
Crypto Officer	Role	CO	None

Table 12: Roles

The module supports the Crypto Officer role only. This sole role is implicitly and always assumed by the operator of the module. No support is provided for multiple concurrent operators.

4.3 Approved Services

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Message digest	Compute a message digest	crypto_shash_init returns 0	Message	Digest value	Hashing	Crypto Officer
Encryption	Encrypt a plaintext	crypto_skcipher_sekey returns 0	AES key, plaintext	Ciphertext	Encryption with AES	Crypto Officer - AES key: W,E
Decryption	Decrypt a ciphertext	crypto_skcipher_sekey returns 0	AES key, ciphertext	Plaintext	Decryption with AES	Crypto Officer - AES key: W,E
Authenticated encryption	Encrypt and authenticate a plaintext	For all except AES GCM: crypto_aead_setkey returns 0; For AES GCM: crypto_aead_get_flags(tfm) has the CRYPTO_TFM_FIPS_COMPLIANCE flag set	AES key, plaintext	Ciphertext, MAC tag	Authenticated encryption with AES	Crypto Officer - AES key: W,E
Authenticated	Encrypt and authentic	For all except AES GCM: crypto_aead_setkey	AES key, ciphertext	Plaintext or failure	Authenticated decryption	Crypto Officer

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
decryption	Decrypt ciphertext	crypto_aead_get_flags(tfm) has the CRYPTO_TFM_FIPS_COMPLIANCE flag set	ciphertext, MAC tag		Decryption with AES	- AES key: W,E
Message authentication generation	Compute a MAC tag	crypto_shash_init returns 0	AES: AES key, message; HMAC: HMAC key, message	MAC tag	Message authentication	Crypto Officer - AES key: W,E - HMAC key: W,E
Message authentication verification	Compute a MAC tag	crypto_shash_init returns 0	AES: AES key, message, MAC tag; HMAC: HMAC key, message, MAC tag	Success/Failure	Message authentication	Crypto Officer - AES key: W,E - HMAC key: W,E
Random number generation	Generate random bytes	crypto_rng_get_bytes returns 0	Output length	Random bytes	Random number generation with DRBGs	Crypto Officer - Entropy input: W,E - CTR_DRBG Seed: G,E - HMAC_DRBG Seed: G,E - Hash_DRBG Seed: G,E -

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
						CTR_DRBG Internal State (V, Key): G,W,E - HMAC_DRBG Internal State (V, Key): G,W,E - Hash_DRBG Internal State (V, C): G,W,E
Error detection code	Compute an EDC (crc32, crct10dif)	None	Message	EDC	None	Crypto Officer
Compression	Compress data (deflate, lz4, lz4hc, lzo, zlibdeflate, zstd)	None	Data	Compressed data	None	Crypto Officer
Generic system call	Use the kernel to perform various non-cryptographic operations	None	Identifier, various arguments	Various return values	None	Crypto Officer
Show version	Return the module name and version information	None	N/A	Module name and version	None	Crypto Officer

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Show status	Return the module status	None	N/A	Module status	None	Crypto Officer
Self-test	Perform the CASTs and integrity tests	None	N/A	Pass/fail	Encryption with AES Decryption with AES Hashing Message authentication Random number generation with DRBGs Signature verification with RSA Authenticated encryption with AES Authenticated decryption with AES	Crypto Officer
Zeroization	Zeroize all SSPs	None	Any SSP	N/A	None	Crypto Officer - AES key: Z - HMAC key: Z - Entropy input: Z - CTR_DRBG Internal State (V, Key): Z - HMAC_DRBG

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
						Internal State (V, Key): Z - Hash_DRBG Internal State (V, C): Z - CTR_DRBG Seed: Z - Hash_DRBG Seed: Z - HMAC_DRBG Seed: Z

Table 13: Approved Services

The table above lists the approved services. The following convention is used to specify access rights to SSPs:

- **Generate (G):** The module generates or derives the SSP.
- **Read (R):** The SSP is read from the module (e.g. the SSP is output).
- **Write (W):** The SSP is updated, imported, or written to the module.
- **Execute (E):** The module uses the SSP in performing a cryptographic operation.
- **Zeroize (Z):** The module zeroizes the SSP.

4.4 Non-Approved Services

Name	Description	Algorithms	Role
AES GCM external IV encryption	Encrypt a plaintext using AES GCM with an external IV	AES-GCM with external IV	CO
Key derivation	Derive a key from a key-derivation key or a shared secret	KBKDF (libkcapi) HKDF (libkcapi)	CO
Password-based key derivation	Derive a key from a password	PBKDF2 (libkcapi)	CO
RSA encryption primitive	Compute the raw RSA encryption of a plaintext	RSA	CO
RSA decryption primitive	Compute the raw RSA decryption of a ciphertext	RSA	CO
RSA signature generation (pre-hashed message)	Generate a digital signature for a pre-hashed message	RSA with PKCS#1 v1.5 padding	CO

Name	Description	Algorithms	Role
RSA signature verification (pre-hashed message)	Verify a digital signature for a pre-hashed message	RSA with PKCS#1 v1.5 padding	CO

Table 14: Non-Approved Services

4.5 External Software/Firmware Loaded

The module does not load external software or firmware.

5 Software/Firmware Security

5.1 Integrity Techniques

The static kernel binary is integrity tested using an HMAC-SHA2-512 calculation performed by the sha512hmac utility (which utilizes the module's HMAC and SHA-512 implementations). An HMAC-SHA2-512 calculation is also performed on the sha512hmac utility and the libkcapi library to verify their integrity.

The libkcapi checks the integrity of the binary of the sha512hmac utility first. The sha512hmac utility is then used to perform an HMAC-SHA2-512 calculation of the kernel's binary to verify its integrity.

After the integrity of the kernel's binary has been verified, the self-test for the RSA signature verification implementation is run. Upon the successful run of this self-test, the RSA signature verification implementation of the kernel (with PKCS#1 v1.5 padding, SHA-256, and a 3072-bit key) is used to verify the integrity of the crypto object files listed in Section 2.2 and loaded at start-up.

5.2 Initiate on Demand

Integrity tests are performed as part of the pre-operational self-tests, which are executed when the module is initialized. The integrity tests can be invoked on demand by unloading and subsequently re-initializing the module, which will perform (among others) the software integrity tests.

6 Operational Environment

6.1 Operational Environment Type and Requirements

Type of Operational Environment: Modifiable

How Requirements are Satisfied:

The operating system provides process isolation and memory protection mechanisms that ensure appropriate separation for memory access among the processes on the system. Each process has control over its own data and uncontrolled access to the data of other processes is prevented.

6.2 Configuration Settings and Restrictions

The module shall be installed as stated in Section 11.1.

Instrumentation tools like the ptrace system call, gdb and strace, as well as other tracing mechanisms offered by the Linux environment such as ftrace or systemtap, shall not be used in the operational environments. The use of any of these tools implies that the cryptographic module is running in a non-validated operational environment.

6.3 Additional Information

The Red Hat Enterprise Linux operating system is used as the basis of other products which include but are not limited to:

- Red Hat Enterprise Linux CoreOS
- Red Hat Ansible Automation Platform
- Red Hat OpenStack Platform
- Red Hat OpenShift
- Red Hat Gluster Storage
- Red Hat Satellite

Compliance is maintained for these products whenever the binary is found unchanged.

7 Physical Security

The module is comprised of software only and therefore this Section is not applicable.

8 Non-Invasive Security

This module does not implement any non-invasive security mechanism and therefore this Section is not applicable.

9 Sensitive Security Parameters Management

9.1 Storage Areas

Storage Area Name	Description	Persistence Type
RAM	Temporary storage for SSPs used by the module as part of service execution	Dynamic

Table 15: Storage Areas

The module does not perform persistent storage of SSPs. The SSPs are temporarily stored in the RAM in plaintext form. SSPs are provided to the module by the calling process and are destroyed when released by the appropriate zeroization function calls.

9.2 SSP Input-Output Methods

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
API input parameters; AF_ALG_type sockets (input)	Operator calling application (TOEPP)	Cryptographic module	Plaintext	Manual	Electronic	

Table 16: SSP Input-Output Methods

9.3 SSP Zeroization Methods

Zeroization Method	Description	Rationale	Operator Initiation
Free cipher handle	Zeroizes the SSPs contained within the cipher handle	Memory occupied by SSPs is overwritten with zeroes, which renders the SSP values irretrievable. The completion of the zeroization routine indicates that the zeroization procedure succeeded.	By calling the appropriate zeroization functions: AES key: <code>crypto_free_skcipher</code> and <code>crypto_free_aead</code> ; HMAC key: <code>crypto_free_shash</code> and <code>crypto_free_ahash</code> ; DRBG internal state: <code>crypto_free_rng</code> ; DRBG seed: <code>crypto_free_rng</code> ; Entropy input string: <code>crypto_free_rng</code>
Remove power from the module	De-allocates the volatile memory used to store SSPs	Volatile memory used by the module is overwritten within nanoseconds when power is removed. Module power off indicates that the zeroization procedure succeeded. The	By removing power

Zeroization Method	Description	Rationale	Operator Initiation
		successful removal of power implicitly indicates that the zeroization is complete.	

Table 17: SSP Zeroization Methods

All data output is inhibited during zeroization.

9.4 SSPs

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
AES key	AES key used for encryption, decryption, and computing MAC tags.	128, 192, 256 bits - 128, 192, 256 bits	Symmetric Key - CSP			Encryption with AES Decryption with AES Authenticated encryption with AES Authenticated decryption with AES
HMAC key	HMAC key.	112-524288 bits - 112-256 bits	Authentication key - CSP			Message authentication
Entropy input	Entropy input used to seed the DRBGs. Compliant with IG D.L.	128-384 bits - 114-343 bits	Entropy input - CSP			Random number generation with DRBGs
CTR_DRBG Seed	DRBG seed derived from entropy input. Compliant with IG D.L.	256, 320, 384 bits - 128, 192, 256 bits	Seed - CSP	Random number generation with DRBGs		Random number generation with DRBGs
Hash_DRBG Seed	DRBG seed derived from	440, 888 bits	Seed - CSP	Random number generation		Random number

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
	entropy input. Compliant with IG D.L.	- 128, 256 bits		n with DRBGs		generation with DRBGs
HMAC_DRBG Seed	DRBG seed derived from entropy input. Compliant with IG D.L.	440, 888 bits - 128, 256 bits	Seed - CSP	Random number generation with DRBGs		Random number generation with DRBGs
HMAC_DRBG Internal State (V, Key)	Internal state of HMAC DRBG instance. Compliant with IG D.L.	320, 512, 1024 bits - 128, 256 bits	Internal state - CSP	Random number generation with DRBGs		Random number generation with DRBGs
CTR_DRBG Internal State (V, Key)	Internal state of Counter DRBG instance. Compliant with IG D.L.	256, 320, 384 bits - 128, 192, 256 bits	Internal state - CSP	Random number generation with DRBGs		Random number generation with DRBGs
Hash_DRBG Internal State (V, C)	Internal state of Hash DRBG instance. Compliant with IG D.L.	880, 1776 bits - 128, 256 bits	Internal state - CSP	Random number generation with DRBGs		Random number generation with DRBGs

HMAC_DRBG Seed		RAM:Plaintext	While the DRBG is being instantiated	Free cipher handle Remove power from the module	Entropy input:Derived From HMAC_DRBG Internal State (V, Key):Derives
HMAC_DRBG Internal State (V, Key)		RAM:Plaintext	From DRBG instantiation until DRBG is un-instantiated	Free cipher handle Remove power from the module	HMAC_DRBG Seed:Derived From
CTR_DRBG Internal State (V, Key)		RAM:Plaintext	From DRBG instantiation until DRBG is un-instantiated	Free cipher handle Remove power from the module	CTR_DRBG Seed:Derived From
Hash_DRBG Internal State (V, C)		RAM:Plaintext	From DRBG instantiation until DRBG is un-instantiated	Free cipher handle Remove power from the module	Hash_DRBG Seed:Derived From

Table 19: SSP Table 2

9.5 Transitions

The SHA-1 algorithm as implemented by the module will be non-approved for all purposes, starting January 1, 2031.

10 Self-Tests

10.1 Pre-Operational Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details
HMAC-SHA2-512 (A5736)	128-bit key	Message Authentication	SW/FW Integrity	Module becomes operational and services are available for use.	Integrity test for kernel binary, libkcapi components and sha512hmac binary
RSA SigVer (FIPS186-5) (A5720)	3072-bit key with SHA-256	Signature Verification	SW/FW Integrity	Module becomes operational and services are available for use.	Integrity test for kernel object files

Table 20: Pre-Operational Self-Tests

The pre-operational software integrity tests are performed automatically when the module is powered on, before the module transitions into the operational state. The algorithms used for the integrity test (i.e., HMAC-SHA2-512 and RSA SigVer with 3072 bit key) run their CASTs before the integrity test is performed. While the module is executing the self-tests, services are not available, and data output (via the data output interface) is inhibited until the pre-operational software integrity self-tests are successfully completed. The module transitions to the operational state only after the pre-operational self-tests are passed successfully.

10.2 Conditional Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
SHA-1 (A5720)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA-1 (A5734)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
SHA-1 (A5735)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA-1 (A5736)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-224 (A5720)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-224 (A5734)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-224 (A5735)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-224 (A5736)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-256 (A5720)	0-8184 bit messages	KAT	CAST	Module becomes operational	Message digest	Module initialization

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
				and services are available for use.		
SHA2-256 (A5734)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-256 (A5735)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-256 (A5736)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-384 (A5720)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-384 (A5734)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are available for use.	Message digest	Module initialization
SHA2-384 (A5735)	0-8184 bit messages	KAT	CAST	Module becomes operational and services are	Message digest	Module initialization

Entropy Source continuous APT	Cutoff C = 355	APT	CAST	Entropy source is operational	Entropy source continuous test	Continuously

Table 21: Conditional Self-Tests

The module performs self-tests on all approved cryptographic algorithms as part of the approved services supported in the approved mode of operation, using the tests shown in the table above. Services are not available, and data output (via the data output interface) is inhibited during the conditional self-tests. If any of these tests fails, the module transitions to the Error State.

10.3 Periodic Self-Test Information

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
HMAC-SHA2-512 (A5736)	Message Authentication	SW/FW Integrity	On demand	Manually

Table 23: Conditional Periodic Information

10.4 Error States

Name	Description	Conditions	Recovery Method	Indicator
Error State	The Linux kernel immediately stops executing	Any self-test failure	Restart of the module	Kernel Panic

Table 24: Error States

In the Error State, the output interface is inhibited, and the module accepts no more inputs or requests (as the module is no longer running).

10.5 Operator Initiation of Self-Tests

All self-tests, with the exception of the continuous health tests, can be invoked on demand by unloading and subsequently re-initializing the module.

11 Life-Cycle Assurance

11.1 Installation, Initialization, and Startup Procedures

The module is distributed as a part of the Red Hat Enterprise Linux 8 (RHEL 8) package in the form of the `kernel-4.18.0-477.72.1.el8_8`, `libkcapi-1.2.0-3.el8_8`, and `libkcapi-hmacalc-1.2.0-3.el8_8` RPM packages.

The module can achieve the FIPS validated configuration as follows.

- During the system installation, add the `fips=1` option to the kernel command line. During the software selection stage, do not install any third-party software. More information can be found at [the vendor documentation](#).
- After the installation, to switch the system into the approved mode, first execute the `fips-mode-setup --enable` command, then restart the system. More information can be found at [the vendor documentation](#).

In both cases, the Crypto Officer must verify the RHEL 8 system operates in the approved mode by executing the `"fips-mode-setup --check"` command, which should output "FIPS mode is enabled."

11.2 Administrator Guidance

After installation of the `kernel-4.18.0-477.72.1.el8_8`, `libkcapi-1.2.0-3.el8_8`, and `libkcapi-hmacalc-1.2.0-3.el8_8` RPM packages, the Crypto Officer must execute the `"cat /proc/sys/crypto/fips_name"` command. The Crypto Officer must ensure that the proper name is listed in the output as follows:

Red Hat Enterprise Linux 8 - Kernel Cryptographic API

Then, the Crypto Officer must execute the `"cat /proc/sys/crypto/fips_version"` and `"rpm -q libkcapi"` commands. These commands must output the following (one line per output):

```
4.18.0-477.72.1.el8_8.x86_64  
libkcapi-1.2.0-3.el8_8.x86_64
```

11.3 Non-Administrator Guidance

There is no non-administrator guidance.

11.4 End of Life

As the module does not persistently store SSPs, secure sanitization of the module consists of unloading the module. This will zeroize all SSPs in volatile memory. Then, if desired, the `kernel-4.18.0-477.72.1.el8_8`, `libkcapi-1.2.0-3.el8_8`, and `libkcapi-hmacalc-1.2.0-3.el8_8` RPM packages can be uninstalled from the RHEL 8 system.

12 Mitigation of Other Attacks

The module does not offer mitigation of other attacks and therefore this Section is not applicable.

Appendix A. Glossary and Abbreviations

AES	Advanced Encryption Standard
API	Application Programming Interface
CAST	Cryptographic Algorithm Self-Test
CAVP	Cryptographic Algorithm Validation Program
CBC	Cipher Block Chaining
CCM	Counter with Cipher Block Chaining-Message Authentication Code
CFB	Cipher Feedback
CMAC	Cipher-based Message Authentication Code
CMVP	Cryptographic Module Validation Program
CSP	Critical Security Parameter
CTR	Counter
DRBG	Deterministic Random Bit Generator
ECB	Electronic Code Book
FIPS	Federal Information Processing Standards
GCM	Galois Counter Mode
GMAC	Galois Counter Mode Message Authentication Code
HMAC	Keyed-Hash Message Authentication Code
IPsec	Internet Protocol Security
KAT	Known Answer Test
MAC	Message Authentication Code
NIST	National Institute of Science and Technology
PAA	Processor Algorithm Acceleration
PKCS	Public-Key Cryptography Standards
RSA	Rivest, Shamir, Addleman
SHA	Secure Hash Algorithm
SSP	Sensitive Security Parameter
XTS	XEX-based Tweaked-codebook mode with cipher text Stealing
