1 General

1.1 Overview

This document is the non-proprietary FIPS 140-3 Security Policy for the Summit Linux FIPS Core Crypto Module, firmware version 11.0. It contains the security rules under which the module must be operated and describes how this module meets the requirements as specified in FIPS 140-3 (Federal Information Processing Standards Publication 140-3) for a Security Level 1 module.

This Security Policy contains non-proprietary information. All other documentation submitted for FIPS 140-3 conformance testing and validation is proprietary and is releasable only under appropriate non-disclosure agreements.

1.1.1 How this Security Policy was prepared

The vendor has provided the non-proprietary Security Policy of the cryptographic module, which was further consolidated into this document by atsec information security together with other vendor-supplied documentation. In preparing the Security Policy document, the laboratory formatted the vendor-supplied documentation for consolidation without altering the technical statements therein contained. The further refining of the Security Policy document was conducted iteratively throughout the conformance testing, wherein the Security Policy was submitted to the vendor, who would then edit, modify, and add technical contents. The vendor would also supply additional documentation, which the laboratory formatted into the existing Security Policy, and resubmitted to the vendor for their final editing.

1.2 Security Levels

Section	Title	Security Level
1	General	1
2	Cryptographic module specification	1
3	Cryptographic module interfaces	1

9	Sensitive security parameter management	1
10	Self-tests	1
11	Life-cycle assurance	1
12	Mitigation of other attacks	1
	Overall Level	1

Table 1: Security Levels

2 Cryptographic Module Specification

2.1 Description

Purpose and Use:

The Summit Linux FIPS Core Crypto Module (hereafter referred to as the "module") is a firmware module supporting FIPS 140-3 Approved cryptographic algorithms. The module is composed by firmware components comprised of a kernel and OpenSSL library. These firmware components provide a C language application program interface (API) for use by other processes that require cryptographic functionality.

The module offers approved cryptographic functions in the approved mode for, among other uses:
- Algorithms for use in the Wi-Fi protocols CCMP and GCMP.
- Algorithms for use in the TLS protocol.
- Encryption and decryption for data at rest.

Module Type: Firmware

Module Embodiment: MultiChipStand

Cryptographic Boundary:

The Summit Linux FIPS Core Crypto Module is defined as a firmware, Multi-Chip Standalone module per the requirements within FIPS 140-3. The cryptographic boundary of the module consists of the firmware component files (kernel, FIPS Provider, and the fipscheck integrity test tool) and the integrity test HMAC files. For easier readability in the rest of the document "OpenSSL FIPS provider" has been shortened to "FIPS provider".

Tested Operational Environment's Physical Perimeter (TOEPP):

Figure 1 below depicts the physical representations of the tested platforms as the top and bottom view of the circuit board. The tested environments are further described in Section 6.
Figure 1: Physical configurations of the tested platform (top and bottom in order).

Figure 2 below shows the block diagram of the module. The cryptographic boundary is indicated with yellow blocks, distributed among firmware components. Blocks of another color do not belong to the cryptographic boundary. Users of the module interact through the API that are the logical interfaces data input, data output, control input, status output. A dotted line encompasses the module's components that interface through the API.

In Figure 2, users of the module are exemplified by applications. These applications may reside within the NAND Flash memory or may reside outside (but still within the physical perimeter), always interacting with the module's API.

The physical perimeter of the module is defined as the perimeter of the circuit board on which the module is installed. The filesystem and operating system reside on NAND Flash memory within the physical perimeter.

Figure 2: Block Diagram
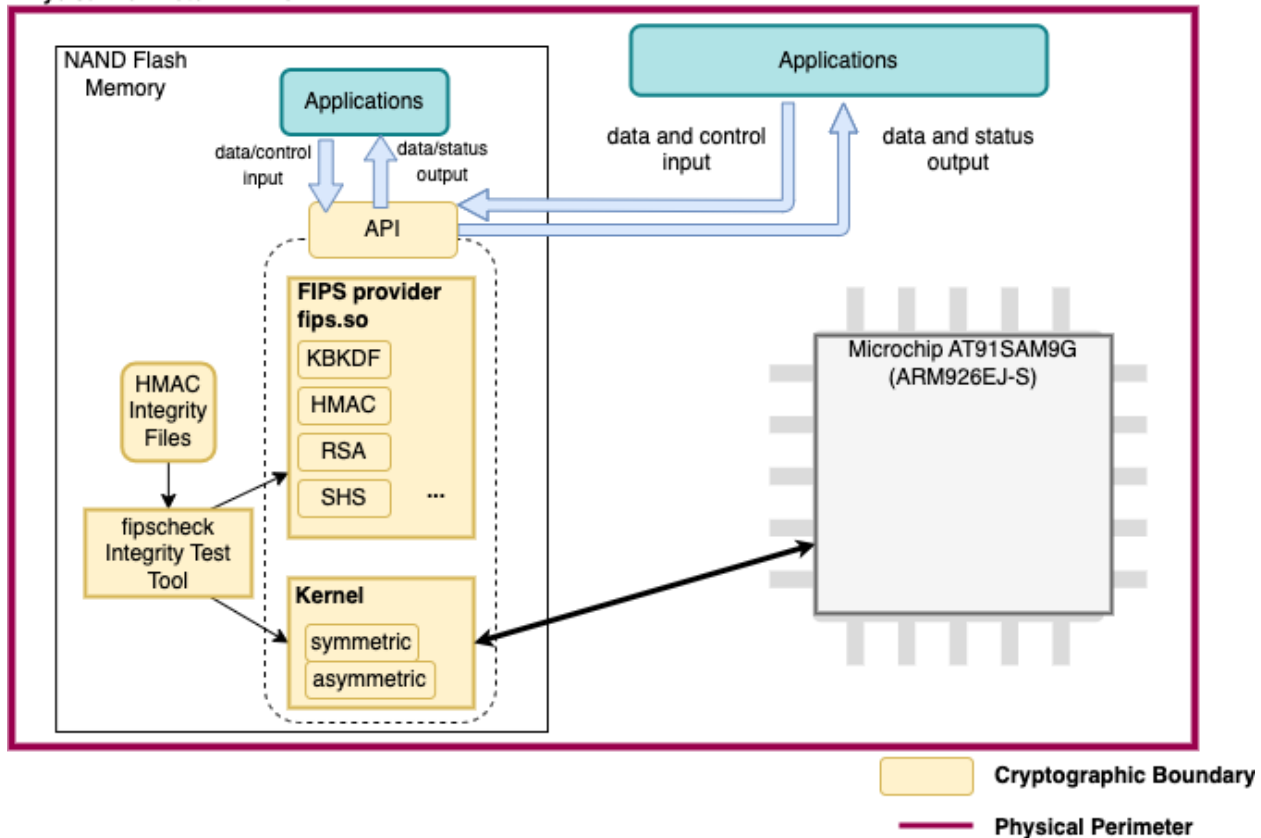

2.2 Tested and Vendor Affirmed Module Version and Identification

Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets):

Package or File Name	Software/ Firmware Version	Features	Integrity Test
Image.lzma, fipscheck (application and library), fips.so	11.0	N/A	HMAC-SHA-256

Table 2: Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets)

Tested Operational Environments - Software, Firmware, Hybrid:

Operating System	Hardware Platform	Processors	PAA/PAI	Hypervisor or Host OS	Version(s)
Summit Linux 11.0	Laird WB5NBT wireless bridge	Microchip AT91SAM9G (ARM926EJ-S), ARMv5-based	No	N/A	11.0

Table 3: Tested Operational Environments - Software, Firmware, Hybrid

CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.

2.3 Excluded Components

There are no components within the cryptographic boundary excluded from the FIPS 140-3 requirements.

2.4 Modes of Operation

Modes List and Description:

Mode Name	Description	Type	Status Indicator
Approved mode	Automatically entered whenever an approved service is requested	Approved	Equivalent to the indicator of the requested service as defined in section 4.3
Non-approved mode	Automatically entered whenever a non-approved service is requested	Non-Approved	

Table 4: Modes List and Description

After passing all pre-operational self-tests and cryptographic algorithm self-tests executed on start-up, the module automatically transitions to the approved mode.

Mode Change Instructions and Status:

The module automatically switches between the approved and non-approved modes depending on the services requested by the operator. The status indicator of the mode of operation is equivalent to the indicator of the service that was requested.

2.5 Algorithms

Approved Algorithms:

Algorithm	CAVP Cert	Properties	Reference
AES-CBC	A4712, A4716, A5002, A5003, A5004	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-CBC-CS1	A5002, A5003, A5004	Direction - decrypt, encrypt Key Length - 128, 192, 256	SP 800-38A

Table 8: Security Function Implementations

2.7 Algorithm Specific Information

2.7.1 AES GCM IV

AES-GCM encryption and decryption are used in the context of the TLS protocol version 1.2 and 1.3 using the FIPS provider component (corresponding to Scenario 1 and 5 of IG C.H), and in the context of IEEE 802.11 GCMP using the kernel/hardware components (corresponding to Scenario 5 of IG C.H). For IPsec, the module offers the AES GCM implementation and uses the context of Scenario 1 of FIPS 140-3 IG C.H. The mechanism for IV generation is compliant with RFC 4106. IVs generated using this mechanism may only be used in the context of AES GCM encryption within the IPsec protocol.

Alternatively, the Crypto Officer can use the module's API to perform AES GCM encryption using internal IV generation. These IVs are always 96 bits and generated using the approved DRBG internal to the module's boundary, compliant with Scenario 2 of FIPS 140-3 IG C.H.

The module also provides a non-approved AES GCM encryption service which accepts arbitrary external IVs from the operator. This service can be requested by invoking the EVP_EncryptInit_ex2 API function with a non-NULL iv value. When this is the case, the API will set a non-approved service indicator.

2.7.1.1 TLS version 1.2

For TLS v1.2, the module uses the context of Scenario 1 of IG C.H. The module is compliant with SP 800-52 section 3.3.1 and the mechanism for IV generation is compliant with RFC5288. For this compliance, the module's implementation of the AES-GCM shall be used together with an application that negotiates the protocol session's keys and the 32-bit nonce value of the IV. The setting of the counter portion of the IV is performed within the cryptographic boundary.

The nonce explicit part of the IV does not exhaust the maximum number of possible values for a given session key. This condition is implicitly ensured by the design of the TLS protocol, in which the nonce_explicit is denied exhaustion by the control exerted by the protocol's management logic (wherein the nonce_explicit is incremented per each TLS record). This management logic also implies that the probability of an exhaustion of all $2^{64} - 1$ values of the nonce_explicit for the same TLS session in a realistic time frame is not significant.

In the event the module's power is lost and restored, the consuming application must ensure that a new key for use with the AES GCM key encryption or decryption under this scenario shall be established.

2.7.1.2 TLS version 1.3

For TLS 1.3, the AES GCM implementation uses the context of Scenario 5 of FIPS 140-3 IG C.H. The protocol that provides this compliance is TLS 1.3, defined in RFC8446 of August 2018, using the cipher-suites that explicitly select AES GCM as the encryption/decryption cipher (Appendix B.4 of RFC8446). The module supports acceptable AES GCM cipher suites from Section 3.3.1 of SP800-52r2. TLS 1.3 employs separate 64-bit sequence numbers, one for protocol records that are received, and one for protocol records that are sent to a peer. These sequence numbers are set at zero at the beginning of a TLS 1.3 connection and each time when the AES-GCM key is changed. After reading or writing a record, the respective sequence number is incremented by one. The protocol specification determines that the sequence number should not wrap, and if this condition is observed, then the protocol implementation must either trigger a re-key of the session (i.e., a new key for AES-GCM), or terminate the connection.

In the event the module's power is lost and restored, the consuming application must ensure that a new key for use with the AES GCM key encryption or decryption under this scenario shall be established.

2.7.1.3 IEEE 802.11 GCMP

The kernel component is in compliance with FIPS 140-3 IG C.H scenario 5 for the WPA2 protocol. Specifically, GCMP is defined in IEEE 802.11ac-2013. For IEEE 802.11 GCMP, the module implements an internal production unit logic that constructs the IV deterministically upon the initialization of a GCMP connection, and therefore the initialization of a GCM encryption context." and "In case the module's power is lost and then restored, the key used for AES GCM encryption or decryption shall be re-distributed.

2.7.2 AES XTS

The length of a single data unit encrypted or decrypted with AES XTS shall not exceed 2^{20} AES blocks, that is 16MB, of data per XTS instance. An XTS instance is defined in Section 4 of SP 800-38E. To meet the requirement stated in IG C.I, the module implements a check to ensure that the two AES keys used in AES XTS mode are not identical.

The XTS mode shall only be used for the cryptographic protection of data on storage devices. It shall not be used for other purposes, such as the encryption of data in transit.

2.7.3 Key derivation using SP 800-132 PBKDF2

The module provides password-based key derivation (PBKDF2), compliant with SP 800-132. The module supports option 1a from Section 5.4 of SP 800-132, in which the Master Key (MK) or a segment of it is used directly as the Data Protection Key (DPK). In accordance to SP 800-132 and FIPS 140-3 IG D.N, the following requirements shall be met:
- Derived keys shall only be used in storage applications. The MK shall not be used for other purposes. The length of the MK or DPK shall be of 112 bits or more.
- Passwords or passphrases, used as an input for the PBKDF2, shall not be used as cryptographic keys.

- The length of the password or passphrase shall be at least 8 characters. The probability of guessing the value, assuming a worst-case scenario of all digits, is estimated to be at most 10^{-8}. Combined with the minimum iteration count as described below, this provides an acceptable trade-off between user experience and security against brute-force attacks.
- A portion of the salt, with a length of at least 128 bits, shall be generated randomly using the SP 800-90Ar1 DRBG provided by the module.
- The iteration count shall be selected as large as possible, as long as the time required to generate the key using the entered password is acceptable for the users. The minimum value is 1000.

2.7.4 SP 800-56Ar3 Assurances

Kernel Component: The module offers ECDH shared secret computation services compliant to the SP 800-56ARev3. In order to meet the required assurances listed in section 5.6 of SP 800-56ARev3, the module shall be used together with an application that implements the "IPsec protocol" and the following steps shall be performed.

1. The entity using the module, must use the module's "key pair generation" service for generating ECDH ephemeral keys. The key generation service performs full public key validation. This meets the assurances required by key pair owner defined in the section 5.6.2.1 of SP 800-56ARev3.
2. The consumer using the module doesn't need to obtain assurance of the peer's possession of private key as the module only makes use of ephemeral keys.
3. As part of the module's shared secret computation service, the module internally performs the public key validation on the peer's public key passed in as input to the SSC function. This meets the public key validity assurance required by the sections 5.6.2.2.1/5.6.2.2.2 of SP 800-56ARev3.

FIPS provider Component: The module offers DH and ECDH shared secret computation services compliant to the SP 800-56ARev3. To comply with the assurances found in Section 5.6.2 of SP 800-56Ar3, the operator must use the module together with an application that implements the TLS protocol. Additionally, the module's approved key pair generation service must be used to generate ephemeral Diffie-Hellman or EC Diffie-Hellman key pairs, or the key pairs must be obtained from another FIPS-validated module. As part of this service, the module will internally perform the full public key validation of the generated public key. The module's shared secret computation service will internally perform the full public key validation of the peer public key, complying with Sections 5.6.2.2.1 and 5.6.2.2.2 of SP 800-56Ar3.

2.7.5 RSA Key Encapsulation

To comply with SP800-56Br2 assurances found in its Section 6 (specifically SP800-56Br2 Section 6.4 Required Assurances) the entity using the module must obtain required assurances listed in section 6.4 of SP 800-56Br2 by performing the following steps:
1. The entity requesting the RSA key un-encapsulation service from the module, shall only use an RSA private key that was generated by an active FIPS validated module that implements FIPS 186-5 compliant RSA key generation service and performs the key pair validity and the pairwise consistency as stated in section 6.4.1.1 of the SP 800-56Br2. Additionally, the entity shall renew these assurances over time by using any method described in section 6.4.1.5 of the SP 800-56Br2.
2. For use of an RSA key encapsulation service in the context of key transport per IG D.G the entity using the module shall:

a. verify the validity of the peer's public key using the public key validation service of the module (EVP_PKEY_check() API).

b. confirm the peer's possession of private key by using any method specified in section 6.4.2.3 of the SP 800-56Br2.

Only after the above assurances are successfully met, shall the entity use the peer's public key to perform the RSA key encapsulation service of the module.

2.7.6 RSA Key Agreement

To comply with the assurances found in Section 6.4 of SP 800-56Br2, the module's approved RSA key pair generation service must be used to generate the RSA key pairs, or the key pairs must be obtained from another FIPS-validated module. As part of this service, the module will internally perform the key pair validity and the pairwise consistency according to section 6.4.1.1 of SP 800-56Br2.

Additionally, the entity requesting the shared secret computation service shall verify the validity of the peer's public key using the public key validation service of the module (EVP_PKEY_check() API). This service will perform the full public key validation of the peer's public key, complying with Section 6.4.2.1 of SP 800-56Br2.

2.7.7 RSA SigGen and SigVer compliance

The module provides RSA signature generation and signature verification compliant with IG C.F.
The module supports RSA modulus lengths of 2048, 3072, and 4096 bits for signature generation and 1024, 2048, 3072, and 4096 for signature verification.
The RSA signature generation and signature verification implementations have been tested for all implemented RSA modulus lengths.
The number of Miller-Rabin tests is consistent with the bit sizes of p and q from Table B.1 of FIPS 186-4.

2.7.8 SHA-3 compliance

The module provides SHA-3 hash functions compliant with IG C.C.
Every implementation of each SHA-3 function was tested and validated on all of the module's operating environments.
SHAKE functions are not implemented.
SHA-3 hash functions are also used as part of a higher-level algorithm for HMAC.

2.8 RBG and Entropy

Cert Number	Vendor Name
E119	Ezurio

Table 9: Entropy Certificates

Name	Type	Operational Environment	Sample Size	Entropy per Sample	Conditioning Component
Summit CPU Time Jitter RNG Entropy Source	Non-Physical	Summit Linux 11.0	64 bits	64 bits	A4713 (SHA3-256)

Table 10: Entropy Sources

The module provides DRBG's compliant with SP800-90A for random number generation and the creation of key components of asymmetric keys. The kernel component DRBG implements a CTR_DRBG mechanism with AES-128, AES-192 or AES-256, with selectable enabling of derivation function and prediction resistance. The FIPS provider component DRBG's implements a CTR_DRBG mechanism with AES-128, AES-192 or AES-256 with selectable enabling of derivation function and prediction resistance. Additionally, a Hash_DRBG and HMAC_DRBG mechanism with SHA-1, SHA-256 or SHA-512 with selectable enabling of derivation function and prediction resistance is implemented. Lastly the kernel and FIPS Provider DRBG's are seeded with 320 bits and assessed to be full entropy in the ESV certificate #E119 at 1 bit/bit or 256 bits of entropy.

2.9 Key Generation

For generating RSA, ECDSA, Diffie-Hellman, EC Diffie-Hellman keys for the FIPS Provider component and ECDSA keys for Kernel component, the module implements asymmetric key generation services compliant with FIPS186-5 or SP800-56Arev3 as applicable and using a DRBG compliant with SP800-90A. The random value used in asymmetric key generation is obtained from the DRBG. In accordance with FIPS 140-3 IG D.H, the cryptographic module performs Cryptographic Key Generation (CKG) for asymmetric keys as per Section 4 of SP800-133rev2 (vendor affirmed).

Additionally, the module implements the following key derivation methods according to section 6.2 of SP 800-133r2:

- HKDF compliant with SP 800-56Cr1: derivation of secret keys in the context of an SP 800-56Ar3 and SP 800-56Br2 key agreement schemes.
- TLS KDF compliant with SP 800-135r1: derivation of secret keys in the context of the TLS 1.0/1.1, TLS 1.2 and TLS 1.3 protocols.
- PBKDF2: compliant with option 1a of SP 800-132: derivation of keys for use in storage applications.
- ANS 9.42 KDF compliant with SP 800-135r1: derivation of secret keys in the context of ANS X9.42-2001 key agreement schemes.
- ANS 9.63 KDF compliant with SP 800-135r1: derivation of secret keys in the context ANS X9.63-2001 key agreement schemes.
- KBKDF compliant with Sp800-108r1: derivation of secret keys.
- KDA OneStep and KDA TwoStep compliant with SP800-56Cr2: derivation of secret keys in the context of SP 800-56Ar3 and SP 800-56Br2 key agreement schemes.

2.10 Key Establishment

The module implements following key establishments methods that are listed in the Security Function Implementations table:
- shared secret computation for KAS-IFC-SSC, KAS-FFC-SSC KAS-ECC-SSC

- key transport for KTS-IFC and KTS-Wrap

2.11 Industry Protocols

For DH, the module supports the use of the safe primes defined in RFC 3526 (IKE) and RFC 7919 (TLS) as listed in Approved Services table. Note that the module only implements key pair generation, key pair verification, and shared secret computation. No other part of the IKE or TLS protocols is implemented (with the exception of the TLS 1.2 and 1.3 KDFs).

SSH KDF, TLS 1.0/1.1 KDF, TLS 1.2 KDF (RFC 7627), TLS 1.3 KDF implementations shall only be used to generate secret keys in the context of the SSH, TLS 1.0/1.1, TLS 1.2, or TLS 1.3 protocols, respectively. Note that TLS 1.2 KDF must be compliant with RFC 7627 to be considered approved.

ANS X9.42 KDF and ANS X9.63 KDF implementations shall only be used to generate secret keys in the context of an ANS X9.42-2001 resp. ANS X9.63-2001 key agreement scheme.

3 Cryptographic Module Interfaces

3.1 Ports and Interfaces

Physical Port	Logical Interface(s)	Data That Passes
N/A	Data Input	API data input parameters, AF_ALG type sockets (kernel component)
N/A	Data Output	API output parameters, AF_ALG type sockets (kernel component)
N/A	Control Input	API function calls, API control input parameters, AF_ALG type sockets (kernel component), kernel command line (kernel component)
N/A	Status Output	API return values, error queue, AF_ALG type sockets (kernel component), kernel logs (kernel component)
N/A	Power	The hardware on which the module runs receives power from the circuit board on which the hardware resides.

Table 11: Ports and Interfaces

The logical interfaces are the APIs through which the applications request services. These logical interfaces are logically separated from each other by the API design.

4 Roles, Services, and Authentication

4.1 Roles

Name	Type	Operator Type	Authentication Methods
Crypto Officer	Role	Crypto Officer	None

Table 12: Roles

The module supports the Crypto Officer role only. This sole role is implicitly and always assumed by the operator of the module. No support is provided for multiple concurrent operators.

4.2 Approved Services

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Kernel Encryption	Encryption	crypto_skcipher_setkey returns 0	AES key, plaintext	ciphertext	Kernel AES-ECB Kernel AES-CTR Kernel AES-CBC Kernel AES-CBC-CS3 Kernel AES-XTS	Crypto Officer - Kernel AES key: W,E

Table 13: Approved Services

The table above lists the approved services. The following convention is used to specify access rights to SSPs:

- **Generate (G):** The module generates or derives the SSP.
- **Read (R):** The SSP is read from the module (e.g. the SSP is output).
- **Write (W):** The SSP is updated, imported, or written to the module.
- **Execute (E):** The module uses the SSP in performing a cryptographic operation.
- **Zeroize (Z):** The module zeroizes the SSP.

To interact with the FIPS provider component of the module, a calling application must use the EVP API layer provided by OpenSSL. This layer will delegate the request to the FIPS provider, which will in turn perform the requested service. The EVP_KDF_CTX_get_params() function can be used to determine whether an EVP API function is approved. After a cryptographic service was performed by the module, the API context associated with this request can contain a parameter (listed below) which represents the approved service indicator.

- _SUMMIT_FIPS_INDICATOR_APPROVED (approved services)
- _SUMMIT_FIPS_INDICATOR_NOT_APPROVED (non-approved services)

The security function implementation "FIPS provider KBKDF Key Derivation" listed for the "FIPS provider Key Derivation" approved service in the table above is intended to derive keys for use of 802.11 protocols.

The Kernel does not provide any non-approved services. The API for the Kernel services listed in the Indicator column, return the specified values that indicate that the services are approved.

4.3 Non-Approved Services

Name	Description	Algorithms	Role
FIPS provider PBKDF with salt length less than 128 bits	Key derivation	FIPS provider PBKDF with salt length less than 128 bits	CO
FIPS provider TLSv1.0 and TLSv1.1 KDF using EMS	Key derivation	FIPS provider TLSv1.0 and TLSv1.1 KDF using EMS	CO
FIPS provider TLSv1.2 KDF without using EMS	Key derivation	FIPS provider TLSv1.2 KDF without using EMS	CO

Table 14: Non-Approved Services

4.4 External Software/Firmware Loaded

The module does not load external software or firmware.

5 Software/Firmware Security

5.1 Integrity Techniques

The integrity of the module's firmware components (the kernel, the FIPS Provider components and fipscheck application and library) is individually verified by the fipscheck integrity test tool using HMAC-SHA2-256 implemented in the FIPS Provider. The FIPS Provider component executes its CASTs (which include the KAT for the integrity technique using HMAC-SHA2-256) before the fipscheck integrity test tool executes to verify the integrity of the module. The HMAC value of each firmware component is computed at build time and stored in the .hmac file for each component. The value is recalculated at runtime for the image of the kernel, FIPS Provider binary and fipscheck application and library, and then compared against the stored value in the file. If the comparison succeeds, then the remaining CASTs (consisting of the Known Answer Tests) for the kernel are performed.

5.2 Initiate on Demand

Integrity tests are performed as part of the pre-operational self-tests, which are executed when the module is initialized. The integrity tests can be invoked on demand by unloading and subsequently re-initializing the module, which will perform (among others) the firmware integrity tests.

6 Operational Environment

6.1 Operational Environment Type and Requirements

Type of Operational Environment: Limited

How Requirements are Satisfied:

The operating system provides process isolation and memory protection mechanisms that ensure appropriate separation for memory access among the processes on the system. Each process has control over its own data and uncontrolled access to the data of other processes is prevented.

6.2 Configuration Settings and Restrictions

The module shall be installed as stated in Section 11.1.

Instrumentation tools like the ptrace system call, gdb and strace, as well as other tracing mechanisms offered by the Linux environment such as ftrace or systemtap, shall not be used in the operational environments. The use of any of these tools implies that the cryptographic module is running in a non-validated operational environment.

7 Physical Security

7.1 Mechanisms and Actions Required

N/A for this module.

The module is enclosed within a production-grade enclosure with components that include standard passivation techniques (e.g., a conformal coating applied over the module's circuitry to protect against environmental or other physical damage) conformant to the Level 1 requirements for physical security.

8 Non-Invasive Security

8.1 Mitigation Techniques

This module does not implement any non-invasive security mechanism and therefore this section is not applicable.

9 Sensitive Security Parameters Management

9.1 Storage Areas

Storage Area Name	Description	Persistence Type
RAM	Temporary storage for SSPs used by the module as part of service execution. The module does not perform persistent storage of SSPs.	Dynamic

Table 15: Storage Areas

The module does not perform persistent storage of SSPs. The SSPs are temporarily stored in the RAM in plaintext form. SSPs are provided to the module by the calling process and are destroyed when released by the appropriate zeroization function calls.

9.2 SSP Input-Output Methods

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
API input parameters	Operating calling application (TOEPP)	Cryptographic module	Plaintext	Manual	Electronic	
Kernel AF_ALG_type sockets (input)	Operating calling application (TOEPP)	Cryptographic module	Plaintext	Manual	Electronic	
API output parameters	Cryptographic module	Operator calling application (TOEPP)	Plaintext	Manual	Electronic	
Kernel AF_ALG type sockets (output)	Cryptographic module	Operator calling application (TOEPP)	Plaintext	Manual	Electronic	

Table 16: SSP Input-Output Methods

9.3 SSP Zeroization Methods

Zeroization Method	Description	Rationale	Operator Initiation
Kernel free cipher handle	Zeroizes the SSPs contained within the cipher handle	Memory occupied by SSPs is overwritten with zeroes, which renders the SSP values irretrievable. The completion of	By calling the appropriate zeroization functions:- AES key: crypto_free_skcipher and crypto_free_aead; - DRBG Internal state: crypto_free_rng; - EC public

Zeroization Method	Description	Rationale	Operator Initiation
		the zeroization routine(s) indicate that the zeroization procedure succeeded	& private key: crypto_free_kpp and crypto_free_akcipher
FIPS provider calling the zeroization API	Zeroizes the SSPs	Memory occupied by SSPs is overwritten with zeroes, which renders the SSP values irretrievable. All data output is inhibited during zeroization. The completion of the zeroization routine(s) indicate that the zeroization procedure succeeded	By calling the appropriate zeroization functions: - EVP_CIPHER_CTX_free(): clears and frees symmetric cipher context; - EVP_MAC_CTX_free(): clears and frees MAC context; - EVP_KDF_CTX_free(): clears and frees KDF context; - EVP_RAND_CTX_free(): clears and frees DRBG context; - EVP_PKEY_free(): clears and frees asymmetric key pair structures
FIPS provider Automatic	Zeroizes the SSPs	Memory occupied by SSPs is overwritten with zeroes, which renders the SSP values irretrievable. All data output is inhibited during zeroization.	Intermediate key generation value: zeroized automatically by the module (after the requested service completed)
Remove power from the module	De-allocates the volatile memory used to store SSPs	Volatile memory used by the module is overwritten within nanoseconds when power is removed. Module power off indicates that the zeroization procedure succeeded.	By removing power

Table 17: SSP Zeroization Methods

All data output is inhibited during zeroization.

9.4 SSPs

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
Kernel AES key	AES key used for encryption, decryption, and computing MAC tags	128, 192, 256 bits - 128,	Symmetric Key - CSP			Kernel AES-CCM (KTS-Wrap) Kernel

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
		192, 256 bits				AES-GCM (KTS-Wrap) Kernel AES CBC with HMAC Kernel AES CTR with HMAC Kernel AES-ECB Kernel AES-CTR Kernel AES-CBC Kernel AES-CBC-CS3 Kernel AES-XTS Kernel AES-CCM (BC-Auth) Kernel AES-GCM (BC-Auth) Kernel AES-CMAC Kernel AES-GMAC
Kernel HMAC key	HMAC key	112-256 bits - 112-256 bits	Authentication key - CSP			Kernel AES CBC with HMAC Kernel AES CTR with HMAC Kernel HMAC
Kernel Intermediate Key	Intermediate key generation value	P-256, P-384 - 128, 192 bits	Intermediate value - CSP	Kernel ECDSA Key		Kernel ECDSA Key

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
Generation Value				Generation		Generation
Kernel shared secret	Shared secret generated by ECDH	P-256, P-384 - 128 and 192 bits	Shared secret - CSP		Kernel KAS-ECC-SSC	
Kernel DRBG seed	DRBG seed derived from entropy input	128, 192, 256 bits - 128, 192, 256 bits	Seed - CSP	Kernel Counter DRBG		Kernel Counter DRBG
Kernel EC public key	Public key used for ECDH	P-256, P-384 - 128, 192 bits	Public key - PSP	Kernel ECDSA Key Generation		Kernel KAS-ECC-SSC
Kernel EC private key	Private key used for ECDH	P-256, P-384 - 128, 192 bits	Private key - CSP	Kernel ECDSA Key Generation		Kernel KAS-ECC-SSC
Entropy input	Entropy input used to seed the DRBGs	320 bits - 256 bits	Entropy input - CSP			Kernel Counter DRBG FIPS provider Counter DRBG FIPS provider Hash DRBG FIPS provider HMAC DRBG
DRBG Internal State (V, Key)	Internal state of Counter DRBG	Counter DRBG: 128, 192, 256 bits; HMAC DRBG: 160-512 bits - 128-256 bits	DRBG Internal state - CSP	Kernel Counter DRBG FIPS provider Counter DRBG FIPS provider HMAC DRBG		Kernel Counter DRBG FIPS provider Counter DRBG FIPS provider HMAC DRBG

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
DRBG Internal state (V, C)	Internal state of Hash and HMAC DRBG	440, 888 bits - 256 bits	DRBG Internal state - CSP	FIPS provider Hash DRBG		FIPS provider Hash DRBG
FIPS provider AES Key	AES key used for encryption, decryption, and computing MAC tags	128, 192, 256 bits - 128, 192, 256 bits	Symmetric Key - CSP			FIPS provider AES-CCM (KTS-Wrap) FIPS provider AES-GCM (KTS-Wrap) FIPS provider AES KWP FIPS provider AES-ECB FIPS provider AES-CTR FIPS provider AES-CBC FIPS provider AES-CBC-CS1 FIPS provider AES-CBC-CS2 FIPS provider AES-CBC-CS3 FIPS provider AES-CFB1 FIPS provider AES-CFB8 FIPS provider AES-XTS FIPS provider

Table 19: SSP Table 2

9.5 Transitions

The SHA-1 algorithm as implemented by the module will be non-approved for all purposes, starting January 1, 2030.

10 Self-Tests

10.1 Pre-Operational Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details
HMAC-SHA2-256 (A5009)	256-bit key	Message Authentication	SW/FW Integrity	Module becomes operational and services are available for use	Integrity test for fips.so; Integrity test for kernel binary; Integrity test for fipsheck binary; Integrity test for fipscheck library

Table 20: Pre-Operational Self-Tests

The pre-operational firmware integrity tests are performed automatically when the module is powered on, before the module transitions into the operational state. The algorithm used for the integrity test (i.e., HMAC-SHA2-256) is self-tested before the firmware integrity test is performed. While the module is executing the self-tests, services are not available, and data output (via the data output interface) is inhibited until the tests are successfully completed. The module transitions to the operational state only after the pre-operational self-tests are passed successfully.

10.2 Conditional Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
ECDSA KeyGen (FIPS186-5) (A4711)	N/A	PCT	PCT	crypto_kpp_generate_public_key returns 0	SP 800-56Ar3 Section 5.6.2.1.4	Key pair generation
SHA2-224 (A4711)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
SHA2-256 (A4711)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
SHA2-384 (A4711)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
SHA2-512 (A4711)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
SHA3-224 (A4713)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
SHA3-256 (A4713)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
SHA3-384 (A4713)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
SHA3-512 (A4713)	0-8184 bit messages	KAT	CAST	Module is operational	Message digest	Module initialization
AES-ECB (A4711)	128, 192, 256 bit keys	KAT	CAST	Module is operational	Encryption, Decryption (Separately)	Module initialization
AES-CBC (A4712)	128, 192, 256 bit keys	KAT	CAST	Module is operational	Encryption, Decryption (Separately)	Module initialization
AES-CTR (A4712)	128, 192, 256 bit keys	KAT	CAST	Module is operational	Encryption, Decryption (Separately)	Module initialization
AES-CCM (A4712)	128, 192, 256 bit keys	KAT	CAST	Module is operational	Encryption, Decryption (Separately)	Module initialization
AES-GCM (A4712)	128, 192, 256 bit keys	KAT	CAST	Module is operational	Message authentication	Module initialization
AES-CMAC (A4712)	128 and 256 bit keys	KAT	CAST	Module is operational	Message authentication	Module initialization
KAS-ECC-SSC Sp800-56Ar3 (A4711)	P-256, P-384	KAT	CAST	Module is operational	Shared secret computation	Module initialization
Counter DRBG (A4711)	128, 192, 256 bit keys with/without PR; Health test per section 11.3 of SP 800-90A	KAT	CAST	Module is operational	Seed Generate	Module initialization
ECDSA KeyGen (FIPS186-5) (A5009)	SHA2-256	PCT	PCT	Successful key generation	Signature generation and verification	EC key pair generation
RSA KeyGen (FIPS186-5) (A5018)	PKCS#1 v1.5 with SHA2-256	PCT	PCT	Successful key generation	Signature generation and verification	RSA key pair generation
Safe Primes Key	N/A	PCT	PCT	Successful key generation	Public key re-computation and	Safe Primes key

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
Generation (A5014)					comparison with the existing public key (per SP 800-56Ar3 Section 5.6.2.1.4)	pair generation
EDDSA KeyGen (A5016)	ED25519 and ED448	PCT	PCT	Successful key generation	Signature generation and verification	EDDSA key pair generation
SHA-1 (A5009)	24-bit message	KAT	CAST	Module is operational	Message Digest	Module initialization
SHA2-512 (A5009)	24-bit message	KAT	CAST	Module is operational	Message Digest	Module initialization
SHA3-256 (A5011)	32-bit message	KAT	CAST	Module is operational	Message Digest	Module initialization
AES-ECB (A5002)	128-bit keys, 128-bit ciphertext	KAT	CAST	Module is operational	Decryption	Module initialization
AES-GCM (A5005)	256-bit keys, 96-bit IVs, 128-bit plaintext, 128-bit additional data	KAT	CAST	Module is operational	Encryption, Decryption (Separately)	Module initialization
KDF SP800-108 (A5017)	Counter mode, HMAC-SHA2-256, 128-bit input key	KAT	CAST	Module is operational	Key Derivation	Module initialization

KTS-IFC (A5018)	SHA-256, no padding	KAT	CAST	Module is operational	Decryption	Module initialization

Table 21: Conditional Self-Tests

The module performs self-tests on all approved cryptographic algorithms as part of the approved services supported in the approved mode of operation, using the tests shown in in the table above. Services are not available, and data output (via the data output interface) is inhibited during the self-tests. If any of these tests fails, the module transitions to the error state.

10.3 Periodic Self-Test Information

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
HMAC-SHA2-256 (A5009)	Message Authentication	SW/FW Integrity	On-demand	Manually

Table 22: Pre-Operational Periodic Information

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
ECDSA KeyGen (FIPS186-5) (A4711)	PCT	PCT	On demand	Manually

ECDSA SigGen (FIPS186-5) (A5009)	KAT	CAST	On demand	Manually

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
ECDSA SigVer (FIPS186-5) (A5009)	KAT	CAST	On demand	Manually
EDDSA SigGen (A5016)	KAT	CAST	On demand	Manually
EDDSA SigVer (A5016)	KAT	CAST	On demand	Manually
KTS-IFC (A5018)	KAT	CAST	On demand	Manually

Table 23: Conditional Periodic Information

10.4 Error States

Name	Description	Conditions	Recovery Method	Indicator
Error State	The module immediately stops functioning due to a self-test failure	Integrity test failure CAST Failure PCT Failure	Reboot and successful completion of self-tests	Module reboots

Table 24: Error States

In the error state, the output interface is inhibited, and the module accepts no more inputs or requests (as the module is no longer running).

10.5 Operator Initiation of Self-Tests

All self-tests, with the exception of the continuous health tests, can be invoked on demand by unloading and subsequently re-initializing the module.

11 Life-Cycle Assurance

11.1 Installation, Initialization, and Startup Procedures

Before deploying the module for usage, the Crypto Officer shall employ the following steps:

1. Verify the HMAC values of each component of the module as listed in section 2.2.

2. Verify that the kernel component command line is configured to run `fipsInit.sh` before any user mode application or init system.

3. Verify that `'fips=1'` parameter is present on the kernel command line for approved mode operation.

11.2 Administrator Guidance

The Crypto Officer must execute the "cat /proc/sys/crypto/fips_name" command. The Crypto Officer must ensure that the proper name is listed in the output as follows:

Summit Linux

This output maps to the module name "Summit Linux FIPS Core Crypto Module".

Next the Crypto Officer must execute "cat /proc/sys/crypto/fips_version". This command must output the following:

11.0

The following are the HMAC values for each of the module components:

- wb45n/lmage.lzma.hmac:3df472065e70a8c176c976c0588170e89b816d3ca1caee5f7 34ea0b187696e13
- wb45n/libfipscheck.so.1.hmac:d193a7627cb9f9b7bae33a1bba2c57fdb52a42710a914 ec57122590a5e63a65c
- wb45n/fipscheck.hmac:1e5bfd65b7a5d351e6cd1445df5cff7dddd62e8d9097ec065bc b877188a5271f
- wb45n/fips.so.hmac:f2eae64d2d5ae6b84995e671d25aba0672408f7b1b247c45a89cb 817276c30f9

11.3 Non-Administrator Guidance

There is no non-administrator guidance.

11.4 End of Life

As the module does not persistently store SSPs, secure sanitization of the module consists of unloading the module. This will zeroize all SSPs in volatile memory.

12 Mitigation of Other Attacks

12.1 Attack List

For the FIPS Provider component, certain cryptographic subroutines and algorithms are vulnerable to timing analysis. The FIPS Provider component mitigates this vulnerability by using constant-time implementations. This includes, but is not limited to:

- Big number operations: computing GCDs, modular inversion, multiplication, division, and modular exponentiation (using Montgomery multiplication).
- Elliptic curve point arithmetic: addition and multiplication (using the Montgomery ladder).
- Vector-based AES implementations.
- In addition, RSA, ECDSA, ECDH, and DH employ blinding techniques to further impede timing and power analysis.

No configuration is needed to enable the aforementioned countermeasures.

Appendix A. Glossary and Abbreviations

AES	Advanced Encryption Standard
API	Application Programming Interface
CAST	Cryptographic Algorithm Self-Test
CAVP	Cryptographic Algorithm Validation Program
CBC	Cipher Block Chaining
CCM	Counter with Cipher Block Chaining-Message Authentication Code
CFB	Cipher Feedback
CMAC	Cipher-based Message Authentication Code
CMVP	Cryptographic Module Validation Program
CSP	Critical Security Parameter
CTR	Counter
CTS	Ciphertext Stealing
DH	Diffie-Hellman
DRBG	Deterministic Random Bit Generator
ECB	Electronic Code Book
ECC	Elliptic Curve Cryptography
ECDH	Elliptic Curve Diffie-Hellman
ECDSA	Elliptic Curve Digital Signature Algorithm
EMS	Extended Master Secret
ENT (NP)	Non-physical Entropy Source
FFC	Finite Field Cryptography
FIPS	Federal Information Processing Standards
GCM	Galois Counter Mode
GMAC	Galois Counter Mode Message Authentication Code
HKDF	HMAC-based Key Derivation Function
HMAC	Keyed-Hash Message Authentication Code
IPsec	Internet Protocol Security
KAT	Known Answer Test
KBKDF	Key-based Key Derivation Function
MAC	Message Authentication Code
NIST	National Institute of Science and Technology
PAA	Processor Algorithm Acceleration
PBKDF2	Password-based Key Derivation Function v2
PKCS	Public-Key Cryptography Standards
RSA	Rivest, Shamir, Addleman
SFI	Security Function Implementation
SHA	Secure Hash Algorithm
SSC	Shared Secret Computation
SSP	Sensitive Security Parameter
TOEPP	Test Operational Environment's Physical Perimeter
XTS	XEX-based Tweaked-codebook mode with cipher text Stealing
